Abstract

This monograph presents the results of research on the morphological and anatomical variability, ecology, and distribution of *Opegrapha* s. l. in Poland. The study is based on roughly 1,400 specimens from Polish and some European herbaria. Out of the 18 species of the genus *Opegrapha* s. l. recorded from Poland, seven species belong to the genus *Opegrapha* Ach., four species now belong to the genus *Alyxoria* Ach. ex Gray, two species each are found in the genera *Arthonia* Ach. and *Zwackhia* Körb, and one species belongs to each of the genera *Gyrographa* Ertz & Tehler, *Phacographa* Hafellner, and *Pseudoschismatomma* Ertz & Tehler. One of the species, *Zwackhia soredifera*, has been reported from Poland for the first time. Among the 18 species of the genus *Opegrapha* s. l., 10 are epiphytic, five epilithic, and two lichenicolous. The first modern identification key for the species of *Opegrapha* s. l. in Poland is presented. Numerous new regional records are provided that complement our knowledge of the geographic distribution of some poorly known taxa, such as *Alyxoria culmigena*, *A. mougeotii*, *A. ochrocheila*, *Arthonia calcarea*, *Opegrapha dolomitica*, *O. geographicola*, *O. lithyrga*, and *Phacographa glaucomaria*. All species are characterized and discussed, and their diagnostic characters illustrated. Geographic ranges of each species in Poland are presented on maps based on revised herbarium materials.

Keywords

lichenized Ascomycota; Arthoniales; Opegraphaceae; Roccellaceae; species variability; distribution maps; Poland

Acknowledgments

This work has been completed due to the kindness of many people. I am particularly grateful to directors, curators, and private owners of herbaria for access to their collections. I would like to sincerely thank Edyta Adamska (Toruń), Urszula Bielczyk (Cracow), Olga Biryukova (Nizhny Novgorod, Russia), Krystyna Czyżewska (Łódź), Stanisław Cieśliński, Anna Łubek, (Kielce), Wiesław Fałtynowicz (Wrocław), Paweł Czarnota (Poręba Wielka), Katarzyna Kolanko (Białystok), Maria Kossowska (Wrocław), Robert Kościelnik (Cracow), Dariusz Kubiak (Olsztyn), Martin Kukwa (Gdańsk), Aleey Melechin (Kirovsk, Russia), Jurga Motiejūnaitė (Vilnius, Lithuania), Eugenia Muchnik (Moscow, Russia), Wiesław Mułenko (Lublin), Maria Olech (Cracow), Žydrūnas Preikša (Vilnius, Lithuania), Ingrida Prigodina-Lukošiene (Vilnius, Lithuania), Alfons Piteráns (Riga, Latvia), Lucyna Śliwa, Adam Flakus (Cracow), Mark Seaward (Bradford, UK), Ulf Schiefelbein (Rostock, Germany), Katarzyna Szczepańska (Wrocław), Andrei Tsurykau (Gomel, Belarus), Michał Węgrzyn (Cracow), and Waldemar Żukowski (Poznań). I owe special thanks to Maciej Rogalski for valuable suggestions and corrections to the manuscript. My sincere thanks are also due to Adam Zająć and Agnieszka Popiela, for their great kind-heartedness, continuous tracking of my research progress, and constructive discussions. Besides, I am grateful to Magdalena Bihun, who spent many hours with me on microscopic observations (SEM). The manuscript was partly translated into English by Sylwia Ufnalska. I would also like to thank anonymous reviewers for helpful comments and valuable suggestions on the manuscript.

Funding

This research was financially supported by the statutory funds of the Department of Ecology and Environmental Protection, University of Szczecin.

1. Introduction

Opegrapha s. l. is a species-rich genus of crustose lichens. Individuals are typically found on the bark of various tree species or on rocks, decaying wood, and thalli of other lichens. They are distributed in all climatic zones across the planet. Although it is difficult to assess the number of species of this genus, the Index Fungorum contains about 600 species in the genus, including all synonyms.

For most of the last century, a taxonomic concept was used for this genus in Europe, which followed Redinger's [1] monograph. However, individual species concepts in that monograph did not deviate substantially from those presented previously by Acharius [2,3], Stizenberger [4], or Nylander [5]. The widespread use of molecular methods resulted in a major change for the systematics of this group. For example, Ertz et al. [6] drew attention to its polyphyly. Moreover, molecular studies resulted in the introduction of a new family, the Lecanographaceae, which included the genera *Alyxoria*, *Lecanographa*, and *Zwackhia* [7,8]. In 2015, several new genera, including *Gyrographa* and *Pseudoschismatomma*, were described in an additional study by Ertz et al. [9].

In Poland, the genus *Opegrapha* has been studied in detail only by Nowak [10], whose methods followed Redinger's monograph [1]. In 1983, Nowak [10] recognized 35 species and numerous intraspecific taxa on the basis of original observations. In 2003, Faltynowicz accepted 14 *Opegrapha* species (with three synonyms) in his lichen checklist of Poland [11]. In Poland, genus *Opegrapha* has recently been well recognized by Bielczyk [12] and Bielczyk et al. [13] in the Carpathians.

The major objectives of this study were to: (i) determine the range of intraspecific variation for selected morphological and anatomical characters using light microscopy (LM) and scanning electron microscopy (SEM); (ii) estimate taxonomic diversity of the genus *Opegrapha* s. l. in Poland, with special emphasis on the *O. vulgata* group; (iii) construct a key for species identification use in Poland; (iv) present distribution ranges for all species recorded from Poland; and (v) analyze habitat preferences of individual species.

2. Research history of the genus

The genus *Opegrapha* first was described by Humboldt in 1793 [14] in the family Graphidaceae. The original description contained three species, but these currently are regarded as synonyms of *Graphis scripta* [15]. The first valid description of the genus *Opegrapha* was provided by Acharius [16] in 1809. This generic name derived from his earlier work published in 1803 [17], where he first used the name *Opegrapha vulgata* (Ach.) Ach. The binomial name *Lichen vulgatus*, from which he took this specific name, came from an earlier publication in 1798 [18]. On the basis of apothecium structure, Acharius [2] divided the genus *Opegrapha* into three

genera: *Arthonia*, *Graphis*, and *Opegrapha*. In total, the newly described genus *Opegrapha* included 24 species [17], with five more species added in 1810 [2]. Santesson [15] suggested that the name given by Acharius could be preserved, as it was also used by Massalongo [19], Leighton [20], Körber [21,22], and Nylander [23,24]. Stizenberger's [4] work, *Über die Steinbewohnenden Opegrapha-Arten*, took into account these earlier works and available materials from contemporary researchers, and attempted to summarize the state of the taxonomy of the group. In his treatment, Stizenberger included 15 species with numerous varieties and forms. It is noteworthy that he was the first author to suggest the creation of the new family Opegraphaceae [4]. However, his suggestion was not widely accepted by other botanists. In 1907, as a result of changes proposed by Zahlbrückner [25], the genus *Opegrapha* was placed in the family Graphidaceae, a family that contained other systematically distinct genera, including *Graphis*, *Xylographa*, and *Encephalographa*. That classification, with slight modifications, was accepted by most lichenologists [1,26]. Redinger [1] then presented a critical work that provided the first detailed concept for the genus *Opegrapha*, which remained valid until the 1970s. Redinger assigned 62 species to this genus that were divided into two sections: *Euopegrapha* with 58 species, and *Pleurothecium* with four species.

For nearly 180 years, the genus *Opegrapha* was included in the family Graphidaceae. In 1970, Ozenda and Clauzade [27] argued that the family Opegraphaceae should be established, because of differences in the structure of the paraphyses. Important modifications were proposed by Poelt [28], with his classification based primarily on the types of asci, paraphyses, and shapes of the ascospores, which allowed him to restore the family Opegraphaceae with the genus *Opegrapha* and placed in the order Arthoniales. In 1986, Eriksson and Hawksworth [29] suggested that the families Opegraphaceae and Roccellaceae should be moved to the order Opegraphales in the class Ascomycetes. The family Opegraphaceae, as defined by Eriksson and Hawksworth [29], was composed of 14 genera, including the genus *Opegrapha*. Nearly 10 years later, Hawksworth et al. [30] modified the classification of the genus *Opegrapha*, excluding it from the family Opegraphaceae. The genus *Opegrapha* then was moved to the family Roccellaceae in the order Arthoniales, and this decision was accepted by lichenologists [31–33].

In the late 1980s, Torrente and Egea [34] published results of their research on the family Opegraphaceae in the Iberian Peninsula, and paid attention to the structure of some anatomical parts that were not considered previously as diagnostic at the genus level within this group. These primarily included ascus structure, with the apical apparatus and ascospore type. In 1998, Grube [33] reviewed the literature on the position and separation of genera within the Arthoniales. Since then, the taxonomic concept for this group of lichens has been continuing to change. In the early twenty-first century, Ertz [35] published the first monograph of the genus *Opegrapha* in the Palaeotropics. He characterized 45 species, including nine new species. Among them, six species have a broad, pancontinental range and are found in Europe as well.

Recently, Ertz et al. [6] used molecular sequence data to reveal that some genera of crustose lichens, such as *Enterographa* and *Opegrapha*, were polyphyletic. Two species previously belonging to the genus *Opegrapha* and occurring in Poland (*O. calcarea* and *O. atra*) were thus placed in the family Arthoniaceae. However, Ertz and Tehler [7] once again restored the family Opegraphaceae, and placed it in the order Arthoniales along with the families Chrysotrichaceae (with the genus *Chrysotricha*), Arthoniaceae (*Arthonia*, *Arthothelium*, *Cryptothecia*, and *Reichlingia*), the newly created family Roccellographaceae (*Dimidiographa*,

Fulvophyton, and *Roccellographa*), and Roccellaceae (*Chiodecton*, *Dendrographa*, *Dirina*, *Enterographa*, *Erythrodecton*, *Lecanactis*, *Roccella*, *Roccellina*, *Schismatomma*, *Sigridea*, and *Syncesia*). In addition to the genus *Opegrapha*, the family Opegraphaceae also included the genera *Combea*, *Dictyographa*, *Dolichocarpus*, *Ingaderia*, *Paralecanographa*, *Paraingaderia*, *Paraschismatomma*, *Pentagenella*, *Schizopelte*, and *Sparria*. Moreover, the authors created a new family, the Lecanographaceae, that contained the new genus *Alyxoria* (including among other species classified earlier as *Opegrapha culmigena*, *O. mougeotii*, *O. ochrolechia*, *O. varia*; see Diederich et al. [36]), the genus *Zwackhia* (with species classified earlier as *Opegrapha viridis* and *O. sorediifera* and several others), and the numerous represented genus *Lecanographa*. However, they noted that the systematic position of the family remained unclear.

In 2015, Ertz et al. [9] suggested that the new genera *Gyrographa* and *Pseudoschismatomma* should be included with *Dendrographa*, *Syncesia*, *Roccellina*, *Schismatomma*, *Lecanactis*, *Roccella*, *Dirina*, *Sigridea*, and *Enterographa* in the family Roccellaceae. Many of the species included earlier in the family Roccellaceae are now part of the Opegraphaceae, Roccellographaceae, and Lecanographaceae.

Tab. 1 summarizes the history of changes in systematic classification of the genus *Opegrapha* s. l. representatives occurring in Poland.

3. Material and methods

This study is based on specimens from herbaria located in Poland (BDPA, KRA, KRAM, KRAP, KTC, LBL, LOD, OLTC, POZ, TRN, UGDA, WA, WRSL) [37], the Institute of Biology, University of Białystok, and abroad [KPABGI, OHHI, RSU (according to Index Herbariorum Rossicum), BILAS, GSU, NNSU, and WI (according to Index Herbariorum)]. Materials from private collections (herb. A. Flakus, herb. M. Kossowska, herb. M. Kukwa, herb. L. Lipnicki, herb. E. Muchnik, herb. K. Szczepańska, herb. U. Schiefelbein, herb. M. Seaward), and specimens collected during my field research from 1997 to 2014 were also included. My field collections are housed in the Herbarium Stetinensis (SZUB). In total, nearly 1,400 specimens (1,206 from Poland) were examined. The Polish material originated from all parts of the country. Detailed data for each examined specimen were recorded. The analyzed morphological and anatomical characters (Tab. 2, Fig. 1) were selected on the basis of the original observations and published resources.

To analyze in detail some of the more subtle structures, such as paraphyses, asci, and spores, material from ascomata cross sections was squashed and stained in a drop of water containing a solution of iodine in potassium iodide (IKI). To observe the color reaction of the walls and apical structures of asci, 10% KOH and Lugol's solution (KOH/IKI) were used. To observe paraphyses, 10% KOH alone was used. Lactophenol cotton blue allowed for visualization of the apical nasse (the dome zone) in asci and ascospore cell walls. The color reaction in thalli was examined using KOH (30% aqueous solution) (K), sodium hypochlorite (C), and paraphenylenediamine (solution in 95% ethyl alcohol) (PD).

Fig. 2 Excipulum types in *Opegrapha* s. l.

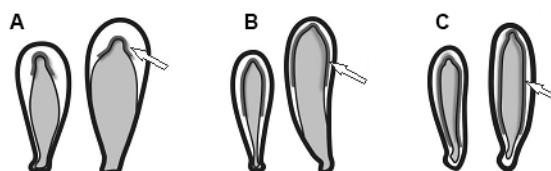

Fig. 3 Three grades of color reaction change for the inner membrane and types of asci in *Opegrapha* s. l.

In this study, five types of excipulum were characterized, depending on their shape in cross sections (see excipulum types in Fig. 2). In addition, I characterized three types of discs, depending on their surface shape (Fig. 3): concave (A), flat (B), or convex (C). On the basis of color reactions of the inner membrane, several types of asci were distinguished, following Torrente and Egea [34].

The various structures of the ascomata were observed and measured under a light microscope (Nikon Eclipse E600 and Zeiss Stereo Lumar v12) (LM), and images were captured with AioVision SE64Rel. 4.8 software. Additionally, a high-quality confocal laser scanning microscope (CLSM) and scanning electron microscope (Quanta 200 SEM) (SEM) were used.

Names of species used throughout the text are in accordance with valid taxonomic classifications [7,9,36]. Nomenclature and author citations follow Index Fungorum. Only basionyms and synonyms used by the authors of the collections are listed under the species. Descriptions and discussions of species are based only on the material examined during the course of this study.

Geographic elements were classified according to Wirth [38], Wirth et al. [39], Purvis et al. [40], and Smith et al. [41].

Ecological characteristics of species of the genus *Opegrapha* s. l. are based on information from labels of herbarium specimens and original field research.

The geographic distribution of individual taxa in Poland was mapped on the ATPOL grid square system [42]. All records marked on the maps were confirmed by relevant herbarium materials. Localities of the studied specimens are listed alphabetically by the ATPOL grid squares and named according to the regional division of Poland [43].

For each species, apart from the distribution map, the following data are given: (i) number of localities (L); (ii) number of squares (10×10 km; S); (iii) diagram of the number of records on particular substrate type, where the following abbreviations are used: Ab – *Abies alba* (fir); Ac – *Acer* spp. (maple); Ae – *Aesculus hippocastanum* (horse chestnut); Al – *Alnus* spp. (alder); Ap – *Acer pseudoplatanus* (sycamore); B – *Betula* spp. (birch); Cb – *Carpinus betulus* (hornbeam); Co – *Corylus avellana* (hazel); Fa – *Fagus sylvatica* (beech); Fr – *Fraxinus excelsior* (ash); l – limestone; Ma – *Malus domestica* (apple); Pa – *Picea abies* (spruce); Ps – *Pinus* spp. (pine); Po – *Populus* spp. (poplar, etc.); Q – *Quercus* spp. (oak); r – rock; Rp – *Robinia pseudoacacia* (false acacia); Sa – *Salix* spp. (willow, etc.); s – sandstone; So – *Sorbus* spp. (mountain ash, etc.); T – *Tilia* spp. (linden); U – *Ulmus* spp. (elm); w – decaying wood.

4. Results and discussion

4.1. Numerical analysis of the examined material

On the basis of material from Poland obtained from 14 lichen herbaria and six private collections, 18 species were identified. According to the latest classifications [7,9,36], the species belong to seven genera. Seven of these species are in the genus *Opegrapha*, two in the genus *Arthonia*, four in the genus *Alyxoria*, two in the genus *Zwackhia*, and one species each in the genera *Gyrographa*, *Pseudoschismatomma*, and *Phacographa*. This is the first time that the species *Zwackhia sorediifera* has been reported from Poland. Two species represent nonlichenized lichenicolous fungi: *Opegrapha geographicola* and *Phacographa glaucomaria*. The largest number of the studied specimens (322) originated from the Herbarium of Jan Kochanowski at the University in Kielce, and slightly fewer (266) came from the lichen herbarium of the W. Szafer Institute of Botany, Polish Academy of Sciences in Cracow (Fig. 4).

Among nearly 1,206 specimens studied from Poland, fewer than 7% were collected before 1945. In contrast, nearly 510 were collected between 1945 and 1980, and over 666 were collected since 1981 (Fig. 5).

The great majority of the examined specimens were from four species: *Alyxoria varia* (334), *Opegrapha vulgata* (230), *Zwackhia viridis* (204), and *Pseudoschismatomma rufescens* (180). Between 12 and 77 specimens were examined for six other species: *O. niveoatra* (77), *O. vermicellifera* (52), *Gyrographa gyrocarpa* (47), *Arthonia atra* (34), *O. dolomitica* (24), and *Alyxoria mougeotii* (12). The smallest number of specimens came from *Alyxoria culmigena* and *Zwackhia sorediifera* (Fig. 6).

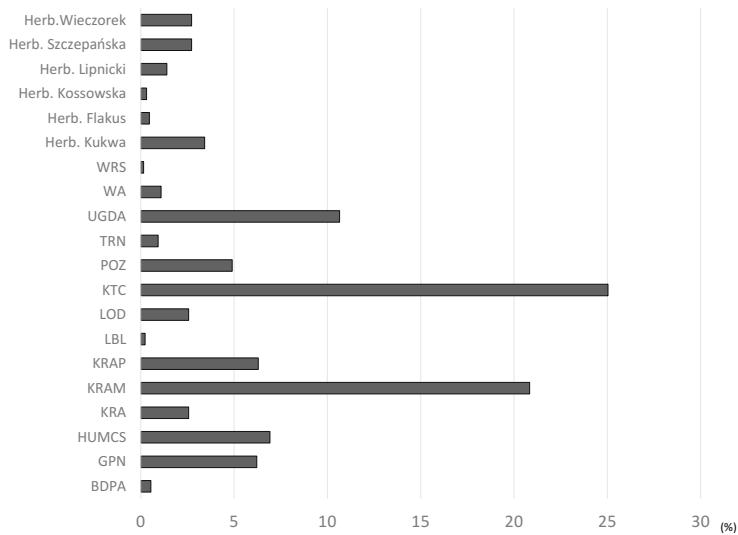

Fig. 4 Percent contribution of examined specimens from various herbaria.

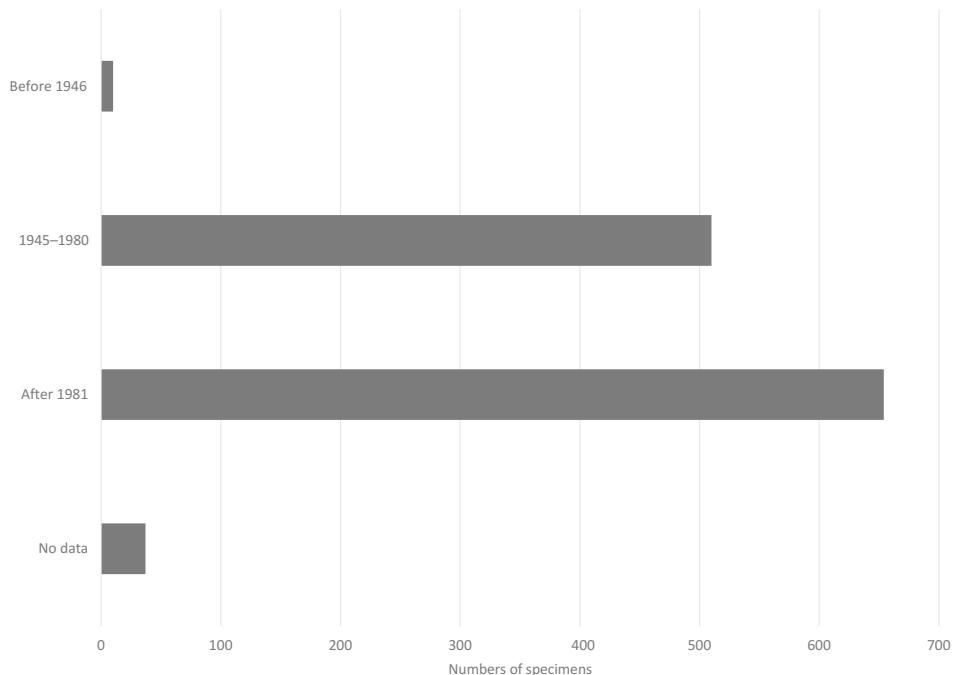

Fig. 5 Number of specimens collected before 1946, between 1945 and 1980, and since 1981.

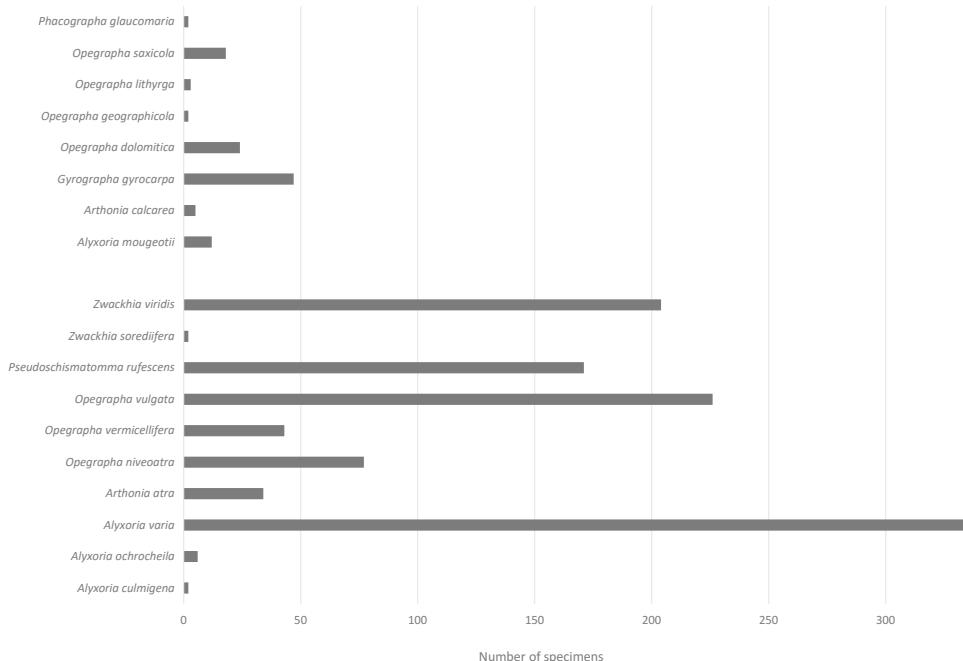

Fig. 6 Number of specimens of individual species of the genus *Opegrapha* s. l. in Poland.

4.2. Morphological features

4.2.1. Thallus

Members of the genus *Opegrapha* s. l. usually are uniformly crustose (Fig. 7) and are found on the bark of various tree species, rocks, plant debris, and the thalli of other lichens. The thallus of lichenized species in the genus *Opegrapha* s. l. is heterogeneous. Thalli of saxicolous species in this genus may be epilithic (growing on the rock surface) or endolithic (penetrating the rock, with a very thin outer layer), whereas epiphytic species always are epiphloeo-dal. Thallus morphology varies widely. It can be uniform or composed of small aggregated nodules, sometimes powdery-granular. Areolate thallus (i.e., subdivided into segments, areoles) usually is found near ascomata or in depressions of the substrate. In *Gyrographa gyrocarpa*, it develops yellowish soralia that often are connected and form larger aggregations of soredia. Sometimes, thalli are covered by delicate crevices or torn into pieces due to cracks in the substrate, such as in a tree bark.

Thallus color is highly variable, consisting of various hues of gray, white, brown, and green, which form lighter patches, clearly distinguished from the substrate, or only slightly different from it (Fig. 8). In some species, thalli are bordered with a conspicuous prothallus of various thickness.

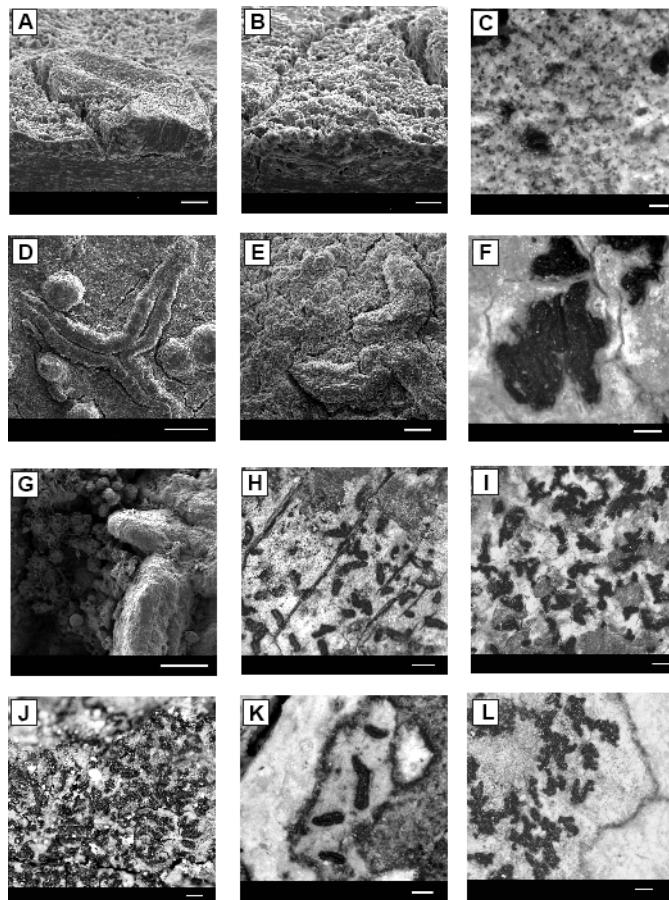

Fig. 7 Thallus: (A) *Opegrapha vermicellifera* – thallus, SEM (leg. W. Faltynowicz, UGDA-L 2469); (B,C) *O. dolomitica* – endolithic thallus, SEM (leg. J. Nowak, KRAM-L 12273); (D) *O. vermicellifera* – thallus smooth, continuous, SEM (leg. A. Wieczorek, 1997, herb. Wieczorek); (E) *O. vulgata* – thallus composed of small aggregated nodules, SEM (leg. J. Nowak, KRAM-L 7289); (F) *Arthonia atra* – thallus crevices, LM (leg. L. Lipnicki, 1989, herb. Lipnicki); (G) *Gyrographa gyrocarpa* – soredia, SEM (leg. P. Czarnota, GPN 2145); (H) *O. niveoatra* – thallus divided by bark cracks, LM (leg. S. Cieśliński & Z. Tobolewski, 1983, KTC); (I) *A. atra* – thallus pale, LM (leg. A. Wieczorek, 2002, herb. Wieczorek); (J) *O. niveoatra* – thallus dark, LM (leg. W. Faltynowicz, UGDA-L 3435); (K,L) *Zwackhia viridis* – prothallus, LM (leg. A. Wieczorek, 1998, herb. Wieczorek). 4.2.2. Algae

Thalli of lichenized species of the genus *Opegrapha* s. l. contain algae of the genus *Trentepohlia* (Fig. 9). The algae form short filaments composed of several cells each that are linked together loosely, particularly in the terminal parts. However, their shape can change depending on water content of the thalli. The algal cells are orange because of a pigment that is a derivative of β carotene and usually masks the green chlorophyll. Each algal cell contains one or several chromatophores.

4.2.3. Ascomata

Species of the genus *Opegrapha* s. l. produce black ascomata classified as hysterothecia, varying in length from 0.1 mm to 2 mm. The ascomata do not (or very rarely) contain a slightly

whitish or yellowish pruinose. In most cases, ascomata are numerous, but rarely, thalli bear only a few or no ascomata. In *O. vermicellifera*, ascomata are rare, but characteristic pycnidia always are developed. An example of sterile, but easily identified species, is *Gyrographa gyrocarpa* (due to the characteristic soralia, stained red with iodine). The other species are unidentifiable when missing ascomata. The ascomata often are distributed evenly on the thallus, but they may also form groups. They usually protrude above the thallus surface and only rarely are they sessile or sunken.

The shape of the ascomata is highly variable and often differs within individual species. They usually are circular, ellipsoid or elongate, more or less branched, rarely vermiform. They are often fused. Only few species are characterized by low intraspecific variability in ascomata shape, such as *Arthonia calcarea*. In the past, many taxonomists regarded the shape of the ascomata as an important diagnostic feature. However, this feature is greatly modified under the influence of changing environmental conditions and is of little importance for taxonomic diagnosis in this genus (Fig. 10).

The ascomata disc is black, and rarely pruinose. Disc shape highly depends on the shape of the ascomata: it may be narrow or wide, often depending on the ascomata's maturity stage. Usually well-developed discs are found in mature specimens, but they are sometimes difficult to distinguish in young specimens. The disc in the genus *Opegrapha* s. l. usually is the widest in the central part of the ascomata and gradually tapers toward the apical parts. Most species are concave or flat, very rarely convex, and the degree of convexity or concavity is highly variable (Fig. 11). Disc's area in SEM images is usually slightly granular. Its structure is shaped by growing apically dilated paraphyses.

The anatomical structure of the apothecia is an important diagnostic feature in the taxonomy of this genus. The ascomata of *Opegrapha* spp. are open (Fig. 12A) and composed of four layers of various thickness: excipulum, hypothecium, hymenium, and pseudoepithecium (Fig. 12B).

The excipulum (also known as the exciple) is the outermost layer of the ascomata (Fig. 13A). In the genus *Opegrapha* s. l., the excipulum is mature throughout the period of the ascomata development. The excipulum is brown-black to black; in some species, the color is continuous at the base of ascoma (Fig. 13B), while in others it is discontinuous (Fig. 13C). The excipulum's edge is well developed, the thickness of the edges in the upper part of the ascomata varies and changes as the ascomata mature. In most cases during early ascomata maturation, the excipulum forms strongly curved upward facing lips (Type A; Fig. 2). However, when the ascomata grow, the excipulum is open (Types B, C, D, and E; Fig. 2). Most species of the genus *Opegrapha* s. l. have the ascomata of Types B and C (Fig. 2), but in a few species (e.g., *Alyxoria varia*), widely opened apothecia develop (Types D and E) (Fig. 14). In these cases, the edge and disc of the excipulum are black.

The hypothecium is the inner part of the ascomata that is located near the excipulum (Fig. 15). It is formed by excipulum hyphae, which grow perpendicularly to the ascocarp. The hypothecium consists of lower parts of ascogenous hyphae. In species of the genus *Opegrapha* s. l., this part of the ascomata is well defined because of the slightly darker color of the adhering hymenium. Like hymenium, the hypothecium can be stained with iodine, though sometimes the reaction is barely visible.

The hymenium is the part of the ascomata that contains asci and paraphyses (Fig. 16A,B). In species of the genus *Opegrapha* s. l., the hymenium is well developed, surrounded by the excipulum, and adheres to the hypothecium. The hymenium is composed of crowded parallel

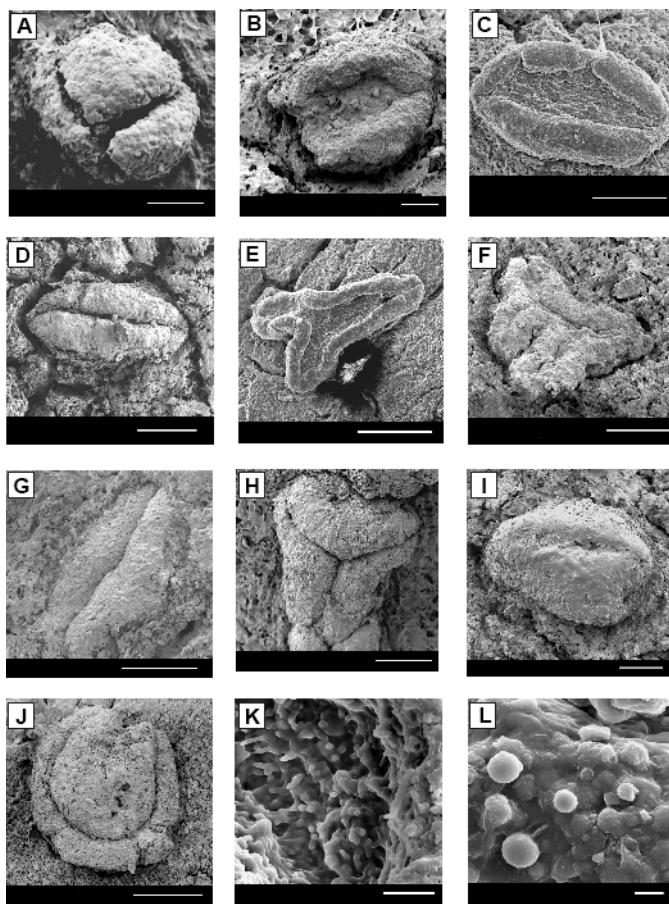

Fig. 10 Morphology of ascomata in *Opegrapha* s. l., SEM: (A) circular, convex, with a very narrow and concave disc (*Arthonia atra*, leg. Z. Tobolewski & S. Cieśliński, 1985, KTC); (B) circular, convex, with a wide and concave disc (*Alyxoria varia*, leg. P. Czarnota, GPN 2875); (C) elongate, convex, with a wide and flat disc (*A. atra*, leg. Z. hyphae, which in the upper layer, near the excipulum, form lips curved toward the hymenium center [34]. In species of the genus *Opegrapha* s. l., the hymenium is yellowish in color.

Paraphyses are formed by sterile hyphae on the hypothecium. In the genus *Opegrapha* s. l., paraphyses are persistent throughout the life span of the ascomata. At the first stages of the ascromatal development, paraphyses are connected to the lower part of the hypothecium. The paraphyses grow perpendicularly to the hypothecium, are crowded and are usually united with asci by means of an interhyphal, hyaline substance (Fig. 16C). In mature ascomata, paraphyses are branched and distally clavate (club-shaped). Usually, they are branched above the asci.

The asci in the genus *Opegrapha* s. l. are cylindrical-clavate and clavate (Fig. 17A,B), usually with a broader base. They are bitunicate, composed of an outer and inner membrane known as the eoascus and endoascus, respectively (Fig. 17C). The eoascus is thin, covers the ascus, and sometimes is amyloid and can be stained with KOH/IKI (Fig. 17D). The endoascus is composed of two layers (inner and outer), which are distinguishable based on their different sensitivity to double treatment with KOH/IKI. The inner layer can be stained blue more intensely, while the outer layer remains unchanged or is stained only slightly. The staining of the inner layer of the endoascus may be limited to the dome zone, be extended to half the ascus height (Fig. 17E), or may extend to the whole length of the ascus. The variation in staining and the structure of the apical apparatus are features that allowed Torrente and Egea [34] to distinguish three types of ascus in the genus *Opegrapha* s. l. The first type, known as the *calcarea* (Fig. 3), is characterized by a short stipe, with the inner layer of the endoascus amyloid only in apical nasse, and a reduced ring with a large locular chamber. The *varia*-type refers to clavate asci with the inner layer of the endoascus amyloid in the upper half or slightly lower, with a short but wide chamber and no apical nasse. The *vulgata*-type has cylindrical-clavate asci, with the inner layer of the endoascus amyloid nearly alongside its whole length, with a small chamber and no apical nasse. At the apex of the ascus, the apical apparatus is located (Fig. 17F,G).

Usually, the asci contain eight spores. During the course of spore growth, the outer membrane is damaged and the inner membrane expands until the ascus walls are destroyed and the spores are released.

Ascospores in the genus *Opegrapha* s. l. are hyaline (besides pale brown in *O. geographica*) and multicellular, with 4–15-septa. Their shape is variable, from elliptic to more or less spindle-shaped (Fig. 18A–E), straight, or slightly curved. Ascospores vary in length from 11 µm to 61 µm, while they are 2 µm to 14 µm wide (including the outer covering, in the widest part of the ascospore) in the hydrated state. Following dehydration, their width can be reduced by up to 2 µm (Fig. 18F). The ascospores have one–two coverings: an inner one known as the epispore, and the outer perispore, the presence or absence of the latter one is an important diagnostic feature (Fig. 18G). The wall of the ascospore is hyaline, but after long periods in a herbarium, it may turn light gray. The length and shape of the ascospores, as well as the number of septa, have been used for species identification since Massalongo [44]. Ascospores in the genus *Opegrapha* s. l. are autofluorescent [45] (Fig. 18H,I).

The pseudoepithecum is the upper most layer of the ascomata and is located above the hymenium. This layer has been given various names. Korf [46] used the term pseudoepithecum to describe the undifferentiated material located above the hymenium. Muthappa [47] believed that the epithecium is a layer composed of remnants of the hymenium, usually consisting of damaged apical parts of paraphyses. Eriksson [48] suggested using the term pseudoepithecum for the layer present in all species having paraphyses. Similarly, Hawksworth

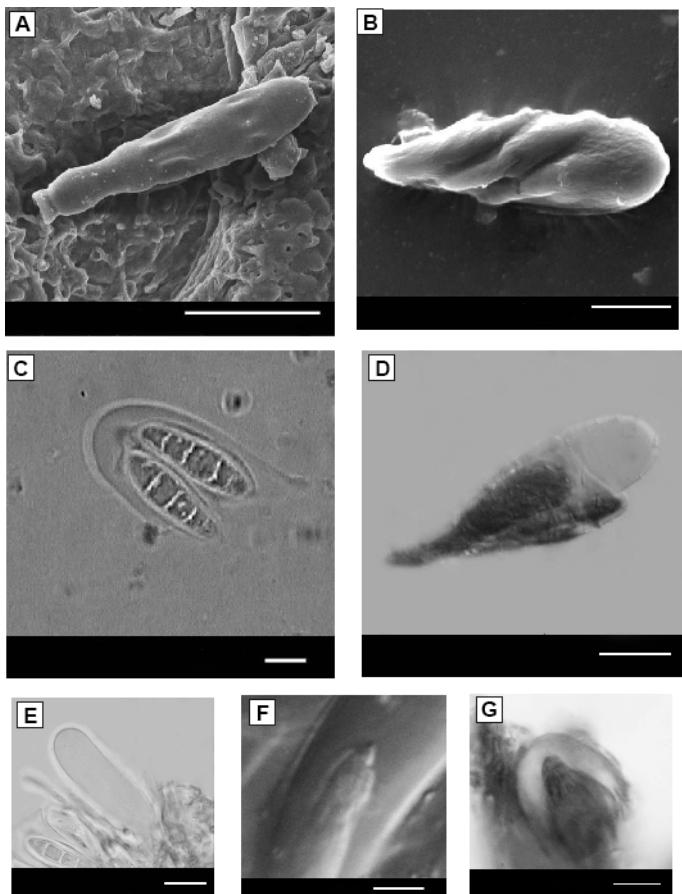

Fig. 17 Asci: (A) cylindrical-clavate, SEM (*Zwackhia viridis*, leg. A. Wieczorek, 1996, herb. Wieczorek); (B) clavate with mature ascospores, SEM (*Pseudoschismatomma rufescens*, leg. Z. Tbolewski, 1955, POZ); (C) two layers of the endoascus, LM (*Opegrapha vulgaris*, leg. J. Nowak, KRAM-L 16223); (D) amyloid outer layer, LM (*Arthonia calcarea*, KRAM-L 26972); (E) outer layer of the endoascus stained to half its length, LM (*Alyxoria varia*, leg. W. Faltynowicz & Z. Tbolewski, KRAM-L 34074); (F) apical apparatus, SEM (*Arthonia calcarea*, KRAM-L 26972); (G) apical nasse, LM (*A. calcarea*, KRAM-L 26972). Scale bars: (A) 30 µm; (B-E,G) 10 µm; (F) 5 µm.

[49] recommended the term pseudoepithecum, defining it as a shapeless granular covering, which embeds the apical parts of paraphyses. Considering the developmental forms of the paraphyses, and in light of the SEM observations in this study, it seems that there is no true epithecium in the genus *Opegrapha* s. l. [34], and thus the use of the term pseudoepithecum appears justified.

Nowak, KRAM-L 17040); (F) dry, young ascospore of *A. atra*, SEM (leg. P. Czarnota, GPN 231); (G) perispore and episporule of *O. dolomitica*, LM (leg. J. Nowak, KRAM-L 12349); (H,I) autofluorescence of *O. dolomitica* spores, CLSM (leg. J. Nowak, KRAM-L 12349). Scale bars: (A,C,E,G) 10 µm; (B,D,F) 5 µm; (H) 20 µm; (I) 25 µm.

4.2.4. Pycnidia

The pycnidia in the genus *Opegrapha* are described in detail in my previous publication [50]. It is noteworthy that in species of this genus, the pycnidia are unilocular, i.e., characterized by only one locule [51] (Fig. 19A,B). The pycnidia are highly variable in shape and size, even within species. Most of the analyzed specimens only had one ostiole (Fig. 19C–E), although some pycnidia had two ostioles at the apex (Fig. 19F). The ostiole is nearly always apical, but it also can develop along any part of the pycnidium. Ostioles usually are circular, but sometimes they can be elongate or irregular. Ostiole size is also highly variable. The pycnidia of the studied species are scattered on thalli or form clusters of various sizes. Most of the analyzed species had prominent pycnidia (Fig. 19G–I, Fig. 20). For example, on one specimen of a given species, some pycnidia were convex, while others were sunken in the thallus. The pycnidia of the epilithic species occurred in more variable locations on the thallus than those of species growing on the bark of trees.

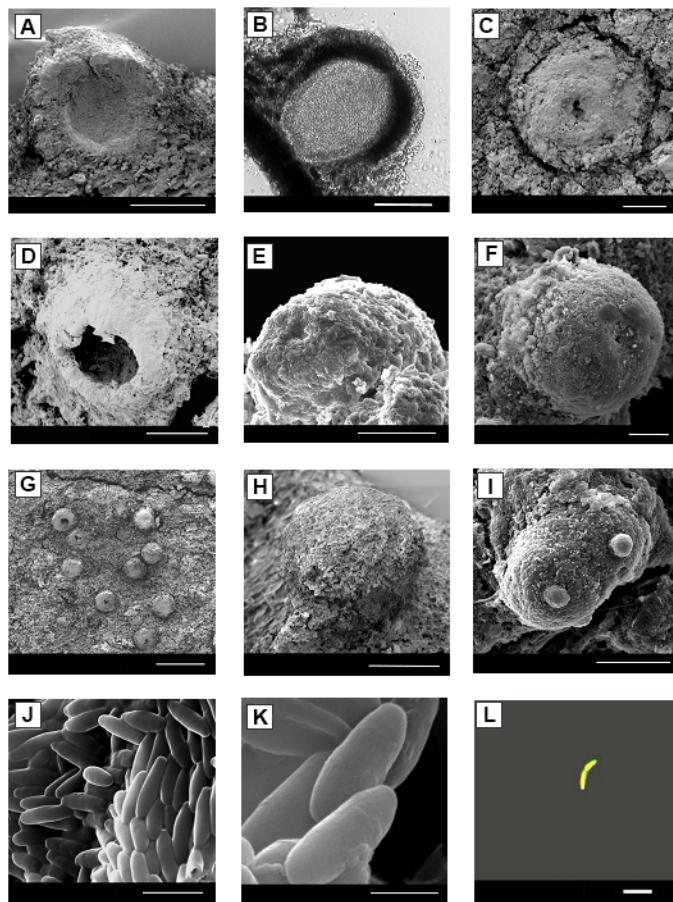

Fig. 19 Pycnidia and conidia of the species of the genus *Opegrapha* s. l.: (A) *O. vulgata*, SEM (leg. J. Nowak, KRAM-L 10343); (B) *O. vermicellifera*, LM (leg. W. Fałtynowicz, UGDA-L 2785); (C) *O. dolomitica*, SEM (leg. J. Nowak, KRAM-L 29981; (D) *O. saxicola*, SEM (leg. K. Szczepańska, 2004, herb. Szczepańska); (E) *Pseudoschismatomma rufescens*, SEM (leg. Z. Tobolewski, 1953, POZ); (F) *Alyxoria varia*, SEM (leg. Z. Tobolewski, 1959, POZ); (G) *O. vermicellifera*, SEM (leg. S. Cieśliński, 1989, KTC); (H) *O. niveoatra*, SEM (leg. W. Fałtynowicz & J. Miądkowska, UGDA-L 3673); (I) *Alyxoria varia*, LM (leg. S. Cieśliński, 1993, KTC); (J) *O. vulgata*, SEM (leg. K. Czyżewska, LOD-L 520); (K) *O. vermicellifera*, SEM (leg. U. Bielczyk, KRAM-L 44575); (L) *O. vulgata*, CLSM (leg. K. Glanc, KRAM-L 39101). Scale bars: (A) 500 µm; (B,C,E,I) 100 µm; (D,F-H) 50 µm; (J,L) 5 µm; (K) 2 µm.

The conidia produced by species of the genus *Opegrapha* s. l. are usually cylindrical or clavate (Fig. 19J,K). The length of the conidia in the material that I analyzed varied between species, even though length is one of the most important taxonomic characters. LM revealed smooth and hyaline conidia, while under a scanning electron microscope, their delicate granular ornamentation could be observed. Similar to ascospores, conidia in the genus *Opegrapha* s. l. are autofluorescent [45] (Fig. 19L).

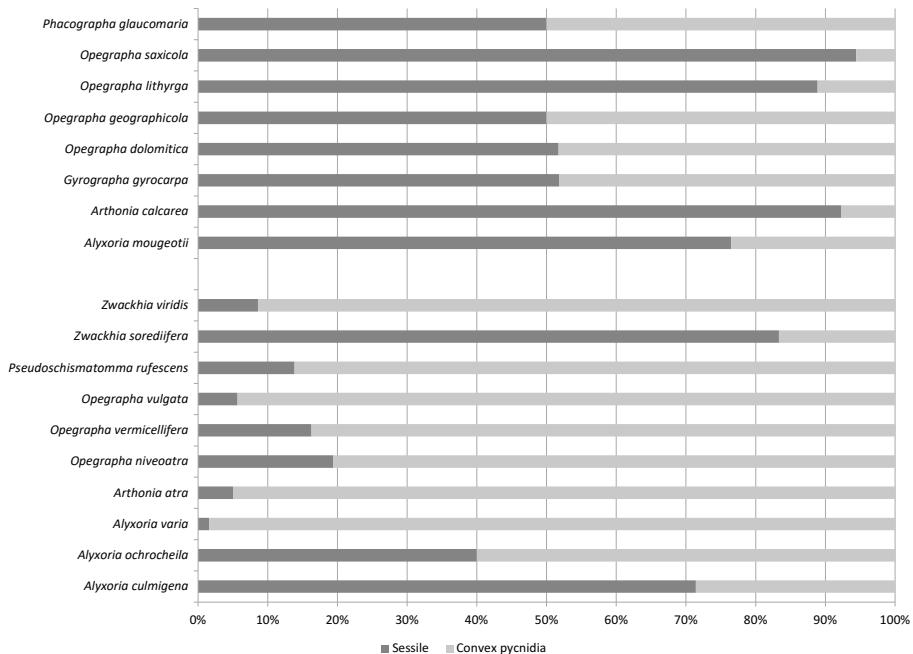

Fig. 20 Percentage of the contribution of sessile and convex pycnidia in the studied material.

4.3. Ecology

Species of the genus *Opegrapha* s. l. in Poland were shown to primarily colonize the bark of various tree species (86% of records), but they also occur on rocks (10%), decaying wood (1%) (Fig. 21), and sporadically on lichen thalli. The species composition of epiphytes and ephilithes is presented in Fig. 22. Unfortunately, labels of the analyzed herbarium specimens did not always contain complete information on habitat. Therefore, there generally was insufficient information to estimate ecological requirements of individual species.

The analyzed taxa were recorded on the bark of 20 genera of trees. Most of them were deciduous phorophytes, except for the conifers, such as *Abies alba*, *Picea abies*, and *Pinus* spp. Representatives of *Opegrapha* s. l. are most frequently found on the smooth bark of *Fagus sylvatica* and the cracked bark of *Fraxinus excelsior*, whilst they are found less frequently on the bark of *Carpinus betulus*, *Acer pseudoplatanus* and other *Acer* spp., *Alnus glutinosa*, and other phorophytes (Fig. 23).

The bark of *Fagus sylvatica* was most often colonized by *Opegrapha niveoatra* and *O. vulgaris*, while the bark of *Fraxinus excelsior* was colonized by *Pseudoschismatomma rufescens*, and the bark of *Carpinus betulus* by *O. niveoatra*.

Nearly all of the epiphytic species are moderately acidophilic. They prefer slightly acid to neutral sites, with a range of pH from 4.9 to 7.0 [38]. They grow on the bark of various tree species, usually in open woodlands and on moderately moist sites, including oak-linden-hornbeam forest, acidophilus and eutrophic beech forests, acidophilus and thermophilous

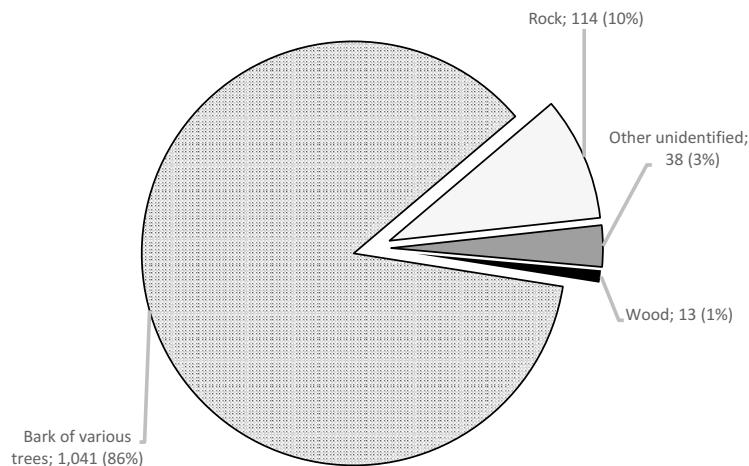

Fig. 21 Numeric and percentage of the contribution of ecological groups in the genus *Opegrapha* s. l.

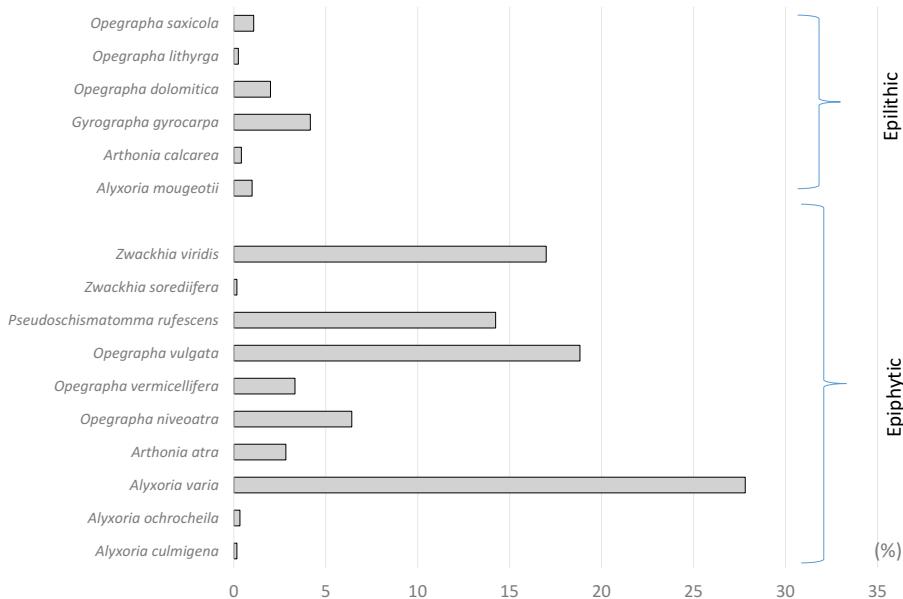

Fig. 22 Percentage contribution of specimens of epiphytic and epilithic species.

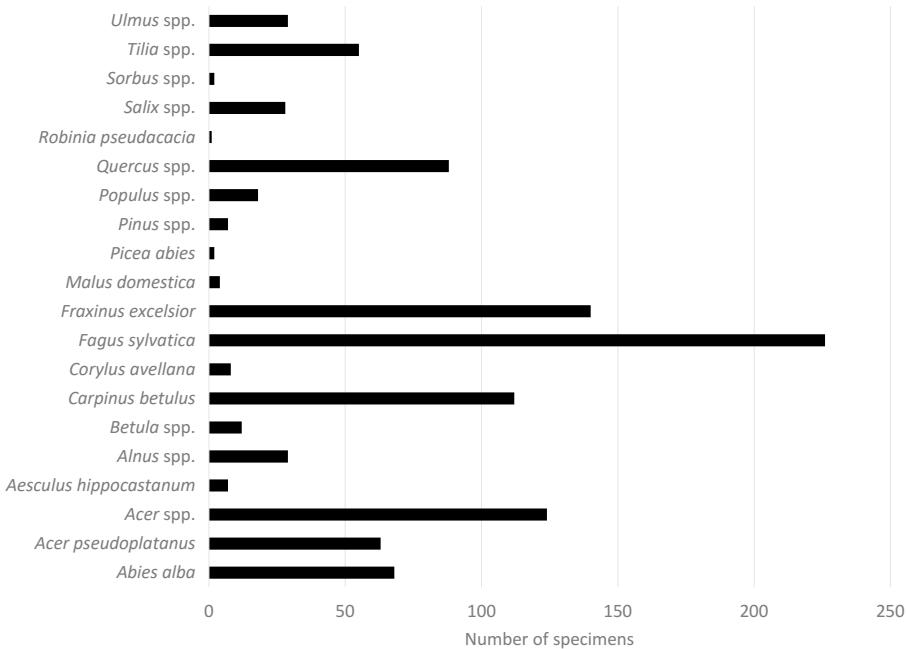

Fig. 23 Number of specimens of epiphytic species of *Opegrapha* s. l. on various phorophytes.

oak forests, streamside alder-ash forest, and black alder bog forest. They are found in plant communities of the *Opegraphetum rufescens* Almb. 1948 ex Klem. 1955 and *Opegraphetum vermicilliferae* Almborn 1948 [38] association.

The most frequently recorded epiphytic species from Poland include *Alyxoria varia* (311 herbarium specimens), *Opegrapha vulgata* (226), and *Pseudoschismatomma rufescens* (164). More research is needed on rare species (*Alyxoria culmigena*, *O. niveoatra*, or *O. vermicillifera*) to determine their distribution and ecological preferences.

All of the recorded epiphytic lichen species, except for *Alyxoria culmigena* and *A. ochrocheila* (extremely rare species), are on the “Red list of threatened lichens in Poland” [52]. One of them, *O. vermicillifera*, is regarded as an indicator of lowland primeval forests [53].

There are six epilithic lichens of the genus *Opegrapha* s. l. found in Poland: *Alyxoria mougeotii*, *Arthonia calcarea*, *Gyrographa gyrocarpa*, *Opegrapha dolomitica*, *O. lithyrga*, and *O. saxicola*. They occur primarily in uplands and mountains, and grow mostly on limestones, but occasionally also on sandstones and other rocks (Fig. 24), shaded and moist sites, or sunlit and moderately dry sites. Species found on natural limestones are highly specific (e.g., *A. calcarea*, *O. dolomitica*, and *O. saxicola*). In contrast, *Gyrographa gyrocarpa* prefers sandstones. The other species, *O. mougeotii* and *O. lithyrga*, are as frequent on both limestone and sandstone. As epilithic lichens, they usually are major components of epilithic moss-lichen communities. For example, Wirth et al. [39] listed *O. gyrocarpa* and *O. lithyrga* as components of mountain lichen grasslands of the alliance *Enterographetum zonatae* (Fegel 1939) Wirth 1972.

The most frequently recorded epilithic species are *Gyrographa gyrocarpa* (both sterile and fertile specimens were noted) and *Opegrapha dolomitica*.

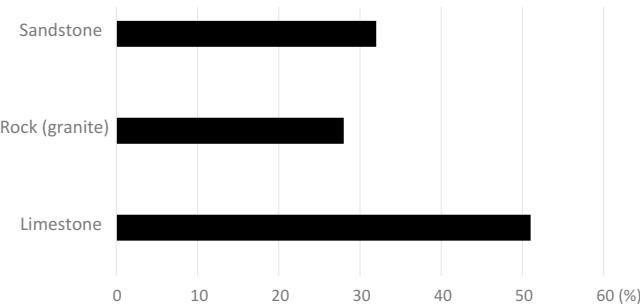

Fig. 24 Percentage contribution of epilithic species on various rocks types.

Three of the epilithic lichen species of this group recorded from Poland (*Arthonia calcarea*, *Gyrographa gyrocarpa*, and *Opegrapha dolomitica*) are threatened in Poland [52]. One of them, *Alyxoria mougeotii*, is on the red list of the Beskid Sądecki Mountains [54].

4.4. Geographic distribution

Opegrapha s. l. is a genus with a wide, pancontinental distribution, as it is known from all continents except Antarctica. Most of the species recorded from Poland are widespread in the country.

Epilithic species are distributed mostly in the southern part of Poland (Fig. 25A). All of them are typical mountain species, found in both the subalpine and montane zones. The

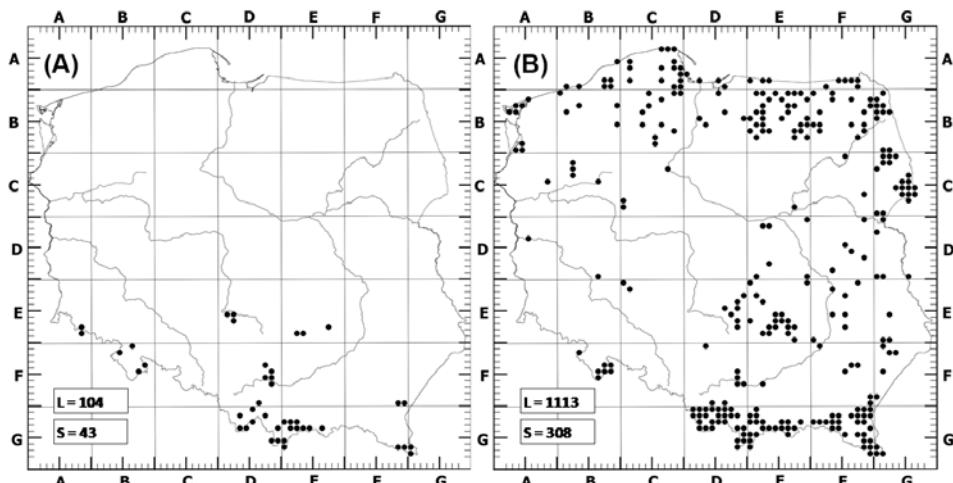

Fig. 25 Distribution of (A) epilithic and (B) epiphytic species of *Opegrapha* s. l. in Poland.

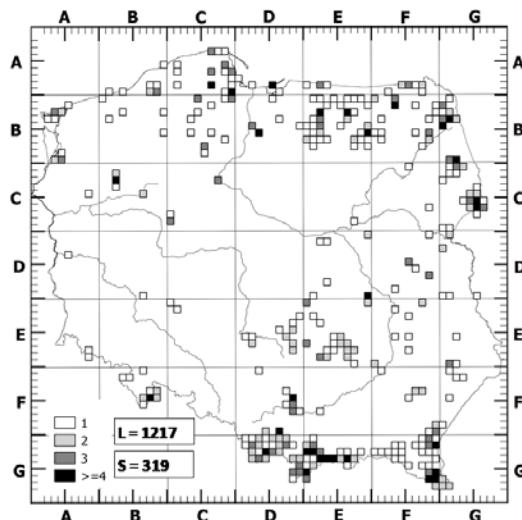

Fig. 26 The number of species of the genus *Opegrapha* s. l. recorded in individual 10×10 -km grids, which are based on the ATPOL grid square system in Poland.

distribution of epiphytic species is associated with extensive natural woodlands. They were recorded both in lowlands and in mountains (Fig. 25B).

The highest species diversity was recorded in southern Poland, in the West Beskids, Tatras, and Bieszczady Mountains. In the north, high diversity occurs in the Pojezierze Mazurskie (Masurian Lake District) and Nizina Północnopodlaska (North Podlachian Lowland) (Fig. 26). The higher number of species in these regions results from the presence of the old, well-preserved forests and more favorable ecological conditions [55,56], but this may be a consequence of more intensive lichen surveys conducted in the area.

4.5. Key to the species of *Opegrapha* s. l. found in Poland

1	Ascospores up to three-septate.....	2
1*	Ascospores 4–15-septate.....	11
2	On rock.....	3
2*	On tree bark, wood, plant debris.....	8
3	Growing directly on rock.....	4
3*	Lichenicolous.....	7
4	Thallus C–, KC–.....	5
4*	Thallus C+ reddish, KC+ reddish.....	<i>Gyrographa gyrocarpa</i> (4.6.7)
5	Asci <i>calcarea</i> -type.....	<i>Arthonia calcarea</i> (4.6.6)
5*	Asci <i>varia</i> -type.....	6
6	Ascospores length <22 µm.....	<i>O. saxicola</i> (4.6.12)

6*	Ascospores length >22 µm.....	<i>O. dolomitica</i> (4.6.8)
7	Hypothecium pale.....	<i>O. geographicola</i> (4.6.9)
7*	Hypothecium dark, grey to grey-brown.....	<i>Phacographa glaucomaria</i> (4.6.15)
8	Asci <i>calcarea</i> -type.....	<i>Arthonia atra</i> (4.6.5)
8*	Asci <i>varia</i> -type.....	9
9	Conidia 12–19 µm long, two–three-septate.....	<i>Alyxoria ochrocheila</i> (4.6.3)
9*	Conidia 4–7 µm long.....	10
10	Ascospores 3–4 µm wide, perispore absent.....	<i>Pseudoschismatomma rufescens</i> (4.6.16)
10*	Ascospores 4–7 µm wide, perispore present.....	<i>Alyxoria culmigena</i> (4.6.1)
11	On rock.....	12
11*	On tree bark, wood, plant debris.....	13
12	Ascospore cells of similar size, asci <i>vulgata</i> -type.....	<i>O. lithyrga</i> (4.6.10)
12*	Middle cell of ascospore enlarged, asci <i>varia</i> -type.....	<i>Alyxoria mougeotii</i> (4.6.2)
13	Ascospores four–six-septate.....	16
13*	Ascospores 6–15-septate, fusiform.....	19
16	Middle cell of ascospore enlarged.....	<i>Alyxoria varia</i> (4.6.4)
16*	Ascospore cells of similar size.....	17
17	Conidia straight, pycnidia whitish pruinose.....	<i>O. vermicellifera</i> (4.6.13)
17*	Conidia straight or curved, pycnidia epruinose.....	18
18	Conidia 4–9 µm long.....	<i>O. niveoatra</i> (4.6.11)
18*	Conidia 9–15 µm long.....	<i>O. vulgata</i> (4.6.14)
19	Perispore 1.5–2.0 µm thick.....	<i>Zwackhia viridis</i> (4.6.18)
19*	Perispore 0.5–0.9 µm thick.....	<i>Zwackhia sorediifera</i> (4.6.17)

= *Opegrapha culmigena* Lib., Pl. crypt. Arduenna, fasc. (Liège) 1: No. 15 (1830).

= *Opegrapha betulina* Sm., in Smith & Sowerby, English Botany. 32: Tab. 2281 (1811).

= *Opegrapha herbarum* Mont., in Guillemin, Arch. Bot. (Forli) 2: 302 (1833).

Thallus thin, smooth or delicately wrinkled, grey-whitish, sometimes with yellow-green tint. Ascomata numerous, solitary or in small groups, short or elongate, unbranched, rarely branched, 0.3–2 × 0.1–0.3 mm. Discs narrow, concave, black, not pruinose. Excipulum thick, elevated, permanent, black, dark brown, K–, continuous below the hypothecium, 35–45 µm thick laterally and 50–90 µm at the base. Hypothecium 40–60 µm high, I+ slightly stained blue. Hymenium 50–70 µm high, hyaline, I+ reddish. Pseudoepithecum up to 25 µm high, I+ pale blue. Asci elongate, cylindrical or elongate-ellipsoid, 40–60 × 15–18 µm, *varia*-type. Ascospores hyaline, spindle-shaped, with blunt ends, three-septate, 18–26 × (4)5–7 µm, with perispore of 0.7–1.2 µm thick. Pycnidia scattered, sunken, visible as very small, blackish dots. Conidia straight, 4–7 × 0.5–1 µm (Fig. 27). Chemistry: thalli K–, C–, PD–.

Scale bars: (A) 1 mm; (B–D, K) 100 µm; (E, F) 250 µm; (G) 20 µm; (H, J) 10 µm; (L) 5 µm.

Discussion. According to Nowak [10], *Alyxoria culmigena* (= *O. herbarum*) is very closely related to *Arthonia atra*, and sometimes they can be difficult to distinguish. My observations show that *Alyxoria culmigena* has slightly longer and straighter ascospores and conidia. Nowak [10] also reported that this species, in comparison to *Arthonia atra*, has wider ascospores, but I could not confirm that report. Other similar epiphytic taxa with three-septate ascospores are *Alyxoria ochrocheila* and *Pseudoschismatomma rufescens*. *Alyxoria culmigena* differs from *A. ochrocheila* by much shorter, unicellular conidia and a lack of pruina, and it differs from *P. rufescens* by having wider ascospores and the presence of a perispore.

Because of the small number of specimens, it is difficult to assess variability within this species. Nowak [10] distinguished two varieties: var. *herbarum* known from France, Germany, and Belgium, and var. *betulina* (Oliv.) J. Nowak reported from Poland. The latter is supposed to have two forms: for. *betulina* and for. *conferta* (Erichs.) J. Nowak. The specimens that I examined produced mostly unbranched (or occasionally branched) ascomata making it difficult to distinguish among the different forms. The population from the Puszcz Barlinecka (Barlinecka Forest) had some features of for. *betulina* that typically has unbranched ascomata, but branched ascomata also were found on the thallus.

According to the latter cited authors, these features justify the creation of a separate genus. Separating the genus *Alyxoria* also was confirmed by results of molecular studies [7] and in my anatomical research.

Nomenclatural notes. This species is one of the first taxa recognized in the genus *Opegrapha*. It was described by Smith in 1811 [57] as *O. betulina*. Under the name *O. herbarum*, it was reported by Montagne in 1833 [58]. Both names (*O. betulina* and *O. herbarum*) of this species have been widely accepted by lichenologists [59,60]. The species was included in the genus *Opegrapha* until recently. Currently, with *O. ochrocheila*, *O. varia*, *O. subelevata* Nyl., and *O. bicolor* R. C. Harris & Lendemer, it is placed in the genus *Alyxoria*. This generic name was first used by Gray [61] to describe *A. diaphora* Gray and *A. notha* (Ach.) Gray, and it was based on the generic name *Alyxorina*, which first was used by Acharius [2]. That name, however, was not accepted, and contemporary lichenologists returned its initial generic name, *Opegrapha* [62–64]. In all *Alyxoria* species, *varia*-type ascospores are produced, which are characterized by a short, wide ocular chamber without an apical nasse, and staining to about half of the inner layer of the endoascus [34]. According to the cited authors [34], these features justify the creation of a separate genus. Separating the genus *Alyxaria* was also confirmed by results of molecular studies [7] and in my anatomical research.

Distribution outside Europe. Species with a wide geographic range, found in Africa (Morocco: [65]), South and North America (Canada [66] and Alaska [67]), Asia (Korea [68] and Taiwan [69]), and in Australia [70].

Habitat and distribution in Europe. *Alyxoria culmigena* is found on smooth bark of these deciduous trees: *Carpinus betulus*, *Fagus sylvatica*, *Acer* spp., *Fraxinus excelsior*, and *Quercus* spp. Occasionally in Belarus, it was recorded from the bark of *Pinus* spp., but rarely from decaying wood or bark of tree trunks.

In Europe it is known from, e.g., Austria [71], Estonia [72], Ireland [73], Italy [74], Portugal (Madeira [75]), and Slovenia [76].

Habitat and distribution in Poland. In Poland, it grows on the bark of *Populus* spp. and *Fagus sylvatica*, where it is probably the rarest species of the genus *Opegrapha* s. l., first reported by Ohlert [77] and Lettau [78]. It was later reported from the Pobrzeże Kaszubskie (Kashubian Coastland) [79], Pobrzeże Szczecińskie (Szczecin Coastland) [80], Pogórze Rożnowsko-Ciężkowickie (Rożnowsko-Ciężkowickie Foothills) [81], Pojezierze Ełckie (Ełk Lakeland) [82], Pojezierze Kaszubskie (Kashubian Lake District) [83], Pomorze Gdańskie (Gdańsk Pomerania) [84], Równina Drawska (Drawno Plain) [85], Równina Ślupska (Ślupsk Plain) [86], and Wyżyna Lubelska (Lublin Upland) [87].

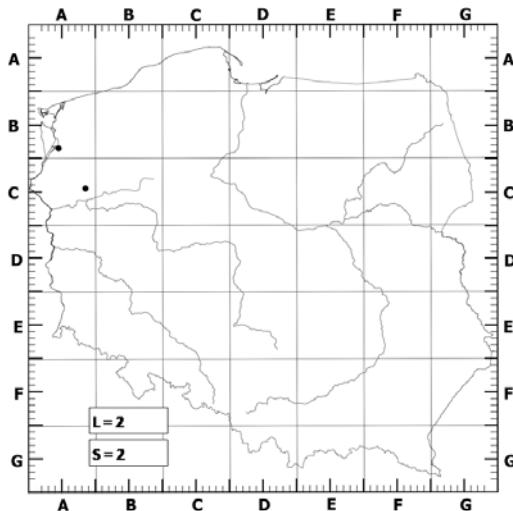

Fig. 28 Distribution of *Alyxoria culmigena* in Poland.

Only two herbarium specimens were available to study from two localities in northwestern Poland (Fig. 28). The records are published here for the first time.

4.6.2. *Alyxoria mougeotii* (A. Massal.) Ertz, Frisch & G. Thor

in Frisch, Thor, Ertz & Grube, Taxon 63(4): 727–744 (2014).

≡ *Opegrapha mougeotii* A. Massal., Memor. Lich.: 103 (1853).

Thallus very thin, poorly developed, continuous or cracked, granulose, whitish, sometimes with grey-brown tint. Ascomata numerous, solitary or in small groups, unbranched or branched, 0.5–2.5 × 0.2–0.4 mm. Discs narrow, very rarely slightly widened, concave or flat, black, not pruinose. Excipulum well defined, permanent, black, naked, dull or sparsely dotted with granules of thallus, continuous below the hypothecium, 30–50 µm thick laterally and 40–70 µm at the base. Hypothecium 20–40 µm high. Hymenium 45–70 µm high, I+ reddish. Pseudoepithecum 1.2–1.5 µm high. Ascii club-shaped, mature 55–70 × 15–20 µm, young 40–55 × 13–15 µm, inner layer of endoascus amyloid in upper part, ring visible around a small ocular chamber (*varia*-type). Ascospores hyaline, spindle-shaped, straight or slightly curved, five–eight-septate, 19–30 × 4–8 µm, with enlarged middle cell, pointed distal cells, and with perispore of 0.8–2 µm thick. Pycnidia sunken in thallus, conidia straight, 4–6 × 1 µm (Fig. 29). Chemistry: thalli K-, C-, PD-.

Discussion. *Alyxoria mougeotii* sometimes resembles *O. saxicola* in the ascocarps shape and thallus habit, but these two species differ in ascospore size and structure. The major distinguishing feature between the species is that *A. mougeotii* has an enlarged middle cell in the ascospore.

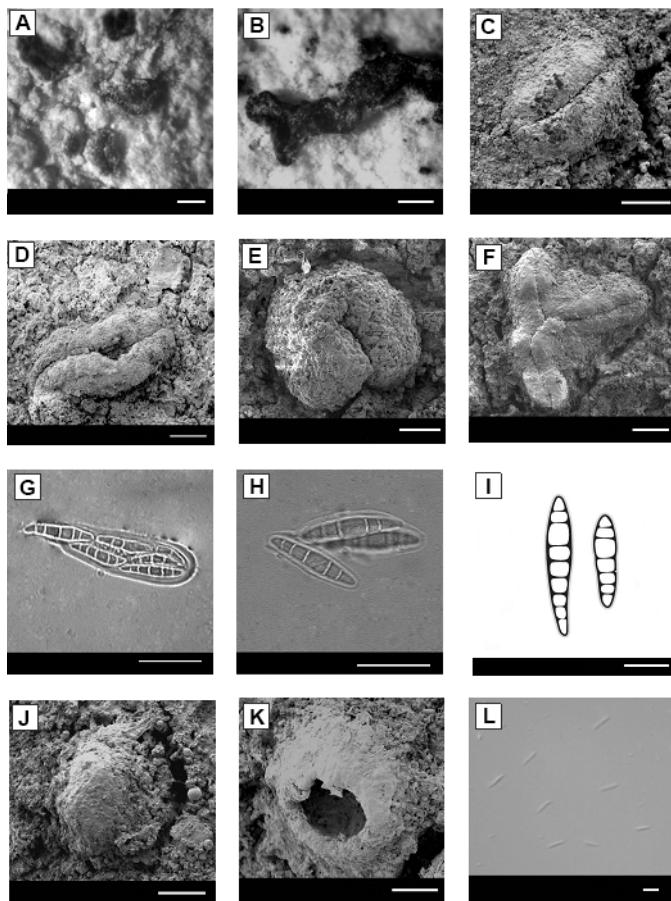

Fig. 29 *Alyxoria mougeotii* (A. Massal.) Ertz, Frisch & G. Thor: (A,B) thallus and ascomata, LM (leg. Z. Tobolewski, 1954, POZ); (C–F) thallus and ascomata, SEM [(C,D) leg. J. Nowak, KRAM-L 4132; (E,F) leg. J. Nowak, KRAM-L 4128]; (G) ascus with ascospores, LM (leg. A. Wieczorek, 1997, herb. Wieczorek); (H,I) ascospores, LM (leg. A. Wieczorek, 1985, herb. Wieczorek); (J,K) pycnidium, SEM (leg. Z. Tobolewski, 1954 Aug 6, POZ); (L) conidia, LM (leg. Z. Tobolewski, 1954, POZ). Scale bars: (A) 200 µm; (B–D,F,K) 100 µm; (E,J) 50 µm; (G–I) 10 µm; (L) 5 µm.

Alyxoria mougeotii has highly variable sizes and shapes of the ascomata, depending on environmental conditions. Their ascomata usually are ellipsoid [var. *lutescens* (Ach.) Redgr.], rarely circular, or strongly elongate and branched (var. *mougeotii*) [10]. In most of the examined ascomata, the disc was narrow and flat or slightly convex. They generally had an excipulum of type B, but only occasionally type C. The white thallus was sessile, and convex pycnidia were observed (Fig. 30).

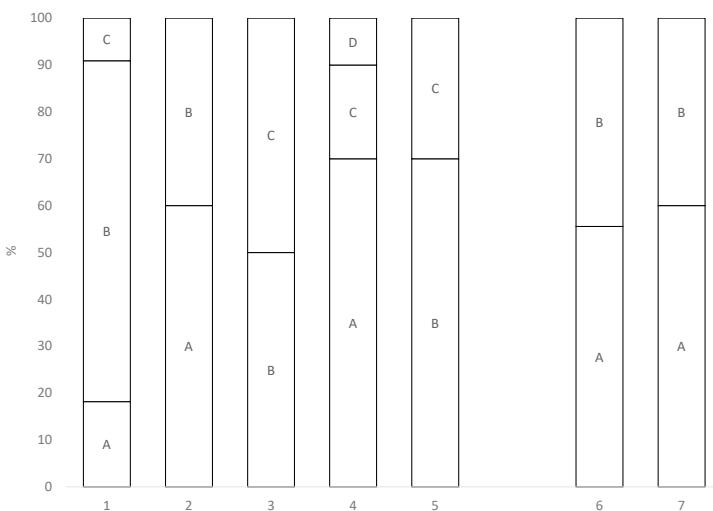

Fig. 30 Variation in selected morphological and anatomical features of *Alxyoria mougeotii*. 1 – ascocarpi shape: A – circular, B – elliptic, C – elongate; 2 – ascocarpi: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Distribution outside Europe. *Alxyoria mougeotii* is known only from a few localities outside of Europe, including Morocco [65] and Tunisia [88] in North Africa.

Habitat and distribution in Europe. Epilithic types are found typically growing on limestone, rarely on sandstone, and in shaded and moist sites. Its distribution has been studied insufficiently. Reported from Austria [71], Estonia [89], Germany [90,91], Great Britain [92], Hungary [93], Ireland [94], Malta [95], the Netherlands [96], Norway [97], Portugal (Madeira, Azores [75,98]), Spain [99], Sweden [97], and Ukraine [100].

Habitat and distribution in Poland. Like other parts of Europe, in Poland *Alxyoria mougeotii* grows on limestone, but less often on sandstone or slate. It grows primarily on vertical or hanging sites that dry and shaded, and occasionally in slightly moist sites. Sometimes, it can be found in partly sunny sites.

Its first records were from the Wąwóz Szopcański [Sobczański] (Szopcański Gorge) (in the Pieniny Mountains) [101]. Later, it was reported from several other localities in the southern part of the country, including the Beskid Sądecki mountain range [102,103], Dolina Dolnego Sanu (Lower San River Valley) [104], Świętokrzyskie Mountains [105], Łąćuch Tatrzanski macroregion [106,107], Niecka Włoszczowska (Włoszczowa Basin) [108], Pagóry Jaworznickie (Jaworzno Hills) [109], Pieniny Mountains [110,111], and Pogórze Przemyskie (Przemyśl Foothills) [112].

The species is rare in Poland (Fig. 31), as it is known only from 13 localities in the Central Beskids or a few more localities in the Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland), Wyżyna Kielecka (Kielce Upland), and Pogórze Przemyskie.

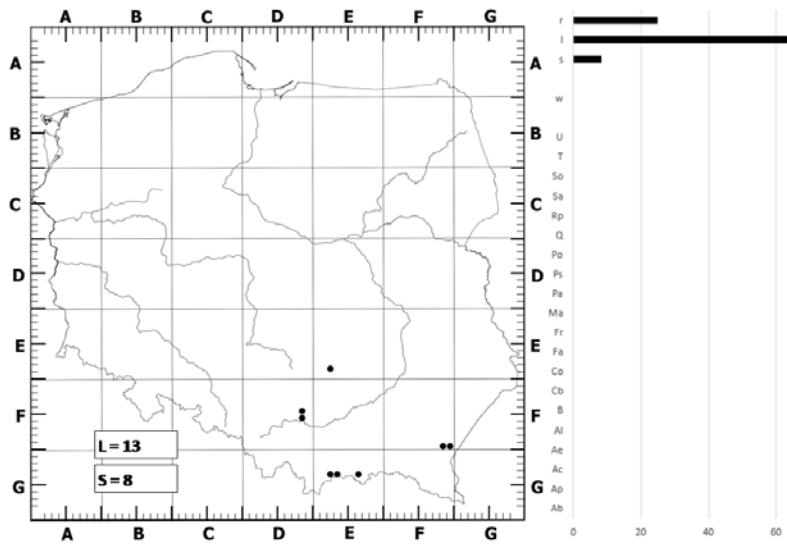

Fig. 31 Distribution and substrate preference of *Alyxoria mougeotii* in Poland.

4.6.3. *Alyxoria ochrocheila* (Nyl.) Ertz & Tehler

Fungal Diversity 49(1): 50 (2011).

≡ *Opegrapha ochrocheila* Nyl., Flora (Regensburg) 48: 212 (1865).

= *Opegrapha rubescens* Sandst., Abh. Naturw. Ver. Bremen 21: 50 (1919).

Thallus thin, continuous, white or grey, covered by orange pruina. Ascomata numerous, solitary or in groups, unbranched or branched, black, $0.5\text{--}2.0 \times 0.2\text{--}0.4$ mm. Discs narrow, sometimes slightly wider in central part, pruinose with rusty-orange pruina. Excipulum relatively thick, elevated, black, pruinose similarly to disc, continuous below the hypothecium, $20\text{--}30 \mu\text{m}$ thick laterally and $40\text{--}50 \mu\text{m}$ at the base. Hypothecium pale brown, $20\text{--}35 \mu\text{m}$ high. Hymenium $50\text{--}65 \mu\text{m}$ high, I+ partly blue-green. Pseudoepitheciwm poorly developed, reddish-brown, $10\text{--}15 \mu\text{m}$ high. Ascii club-shaped, $45\text{--}60 \times 13\text{--}15 \mu\text{m}$, inner layer of endoascus amyloid in upper part (*varia*-type). Ascospores hyaline, ellipsoid, three-septate, $14\text{--}18 \times 4\text{--}5 \mu\text{m}$, with very narrow, hardly visible perispore of $0.4\text{--}0.7 \mu\text{m}$ thick. Pycnidia numerous, small, black. Conidia straight, two-three-septate, $12\text{--}19 \times 1\text{--}2 \mu\text{m}$ (Fig. 32). Chemistry: thalli K-, C- PD-.

Discussion. The major microscopic feature that unambiguously distinguishes *A. ochrocheila* from other epiphytic species are the two-three-septate conidia that are $12\text{--}19 \mu\text{m}$ long. Some specimens that did not produce conidia were reported in the literature [35], but in Poland no such materials were observed. *Alyxoria ochrocheila* is easy to distinguish with the use of a magnifying glass due to the characteristic rusty-orange pruina on the ascomata. Pentecost and James [59] and Ertz [35] described specimens with a nonpruinose ascomata, but all of the specimens from Poland had scattered pruinose ascomata. With respect to ascospores, *A. ochrocheila* has slightly wider ascospores than *Pseudoschismatomma rufescens*, shorter ascospores than *Alyxoria culmigena*, and when compared to *Arthonia atra*, *A. ochrocheila* has no amyloid layer in the ascus and a short chamber without apical nasse.

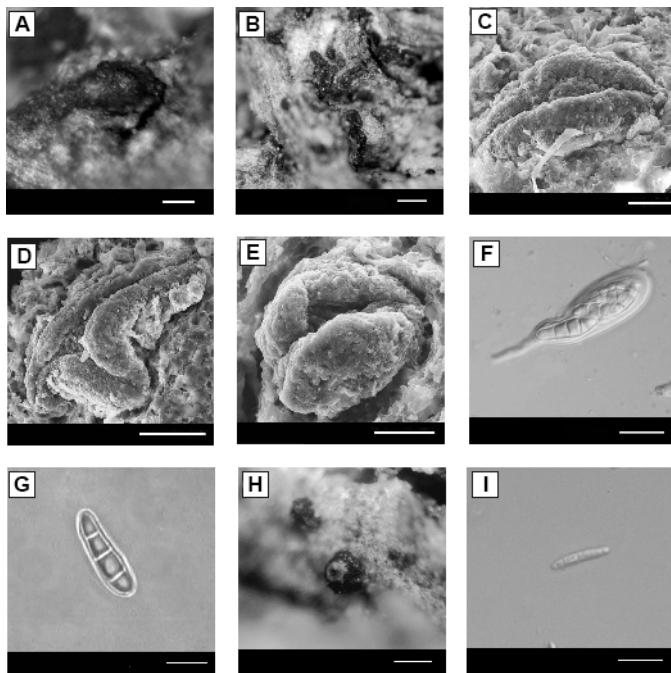

Fig. 32 *Alyxoria ochrocheila* (Nyl.) Ertz & Tehler: (A,B) thallus and apothecia, LM; (C–E) apothecia, SEM; (F) ascus with mature spores, LM; (G) ascospore, LM; (H) pycnidia, LM; (I) conidium, LM (leg. J. Kiszka & J. Nowak, KRAM-L 17736). Scale bars: (A,B) 1 mm; (C,D) 100 µm; (E) 50 µm; (F,G) 10 µm; (H) 500 µm; (I) 20 µm.

The five voucher specimens examined were insufficient to assess intraspecific variation. However, the studied specimens produced mostly solitary, unbranched ascomata, with narrow, exclusively concave discs that were widened sporadically in the central region. Few ascomata were branched. All specimens had relatively numerous, convex pycnidia.

Nomenclatural notes. The species was described in 1865 by Nylander [113], who gave it the binomial *Opegrapha ochrocheila*. Leighton [114] considered it as a form of *O. atra*, which was accepted by Bouly de Lesdain [115] and Smith [116]. However, this treatment was rejected by other researchers, who treated it as a separate species [1,34,38,117–119].

Distribution outside Europe. It is known from North America (e.g., from Canada [66]) and Asia (Armenia [120] and Yemen [121]).

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], *A. ochrocheila* occurs in Central Europe, Mediterranean, and sub-Atlantic regions. It usually grows on the smooth bark of *Fagus sylvatica* and *Carpinus betulus* and usually is found in moist forest communities where the substrate is moderately acidic to neutral: pH 5.7–7.0 [38].

Known from Europe, e.g., from Austria [71], Denmark [122], Estonia [123], Germany [90,124–126], Great Britain [92], Greece [127], Ireland [94], Italy [74], the Netherlands

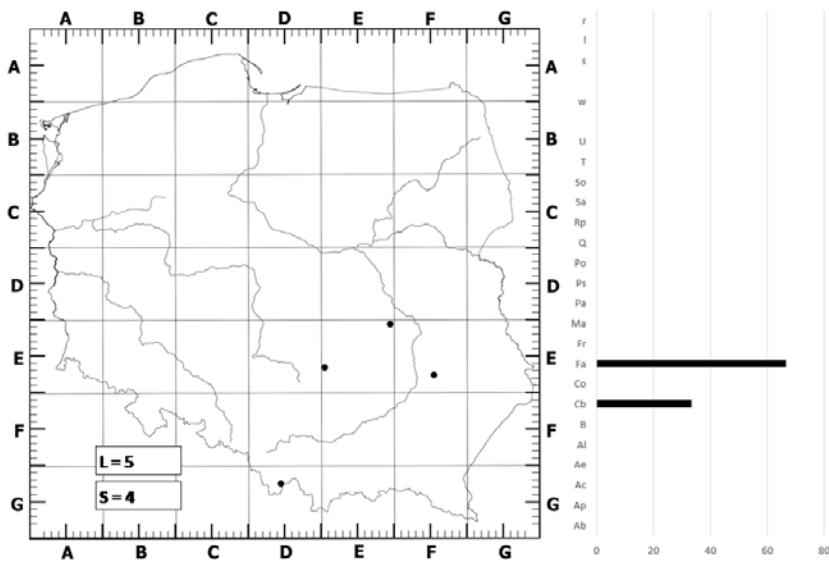

Fig. 33 Distribution and substrate preference of *Alyxoria ochrocheila* in Poland.

[96], Norway [97,128], Portugal (Azores [98]), Slovenia [76], Spain [99], Sweden [128], and Switzerland [129].

Habitat and distribution in Poland. Two of the analyzed specimens grew on the bark of *Fagus sylvatica*, while the third one grew on *Carpinus betulus*. The species was first reported by Migula [130] in northern Poland, and it also was found in the Beskid Sadecki Mountains [103], Beskid Zywiecki Mountains [131], Dolny Śląsk (Lower Silesia Province) [132], Pieniny Mountains [110], Równina Kozienicka (Kozienice Plain) [133], Wzgórza Łopuszańskie (Łopuszańskie Hills) [134].

Based on the available herbarium material, the species occurs in central and southern Poland (Fig. 33).

4.6.4. *Alyxoria varia* (Pers.) Ertz & Tehler

Fungal Diversity 49(1): 53 (2011).

≡ *Opegrapha varia* Pers., Ann. Bot. (Usteri) 1: 30 (1794).

= *Opegrapha diaphora* Ach., Meth. Lich.: 19 (1803).

= *Opegrapha lichenoides* Pers., Ann. Bot. (Usteri) 7: 30 (1794).

= *Opegrapha pulicaris* (Hoffm.) Schrad., in Acharius, Lichenogr. Univ.: 251 (1810).

= *Opegrapha variiformis* Anzi Comm. Soc. crittog. Ital. 1(fasc. 3): 160 (1862).

Thallus thin, smooth or cracked, from white to grey, white-grey and brownish. Ascomata numerous, variable in size and shape, solitary or in small groups, unbranched or branched, 0.3–2.0 × 0.2–0.8 mm. Discs concave, flat or convex, wide, in younger specimens sometimes narrow, usually not, but sometimes pruinose with whitish or yellow pruina. Excipulum black,

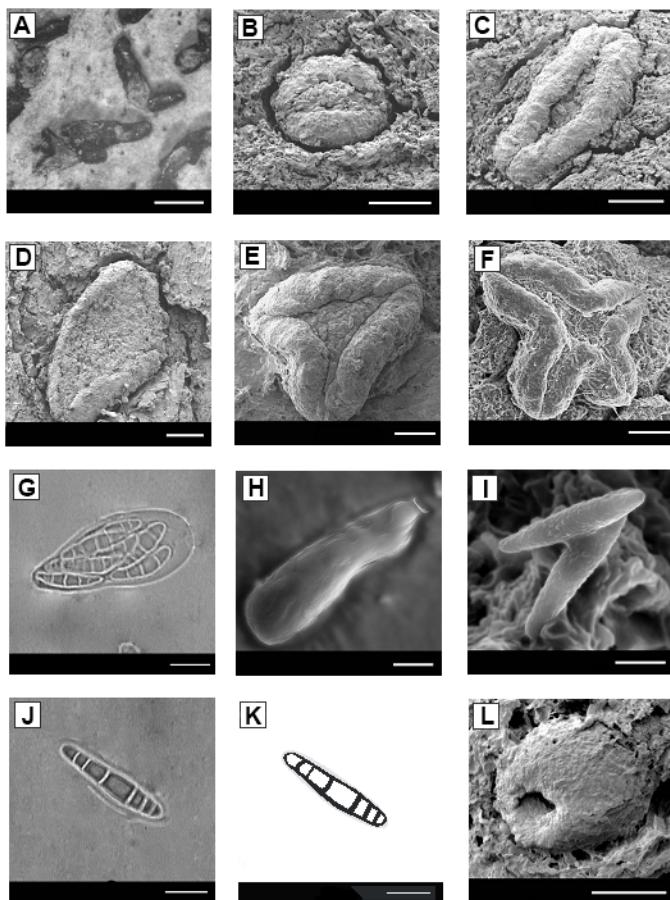

Fig. 34 *Alyxoria varia* (Pers.) Ertz & Tehler: (A) thallus and ascomata, LM (leg. J. Nowak, KRAM-L 14551); (B–F) thallus and ascomata, SEM [(B,D) leg. S. Cieśliński, 1993, KTC; (C) leg. J. Scale bars: (A) 500 µm; (B–G) 100 µm; (H–J) 10 µm; (K) 20 µm; (L) 50 µm.

well defined, permanent, edge thick, lips strongly curved towards hymenium, continuous, rarely discontinuous below the hypothecium, 20–45 µm thick laterally and 30–60 µm at the base. Hypothecium 15–50 µm high, K-. Hymenium hyaline or pale yellowish, 40–80(90) µm high, I+ red-yellow. Pseudoepithecum grey-brown, 10–25 µm high, K-. Ascii club-shaped, 30–70 × 12–18(20) µm, inner layer of endoascus amyloid to half of its length (*varia*-type). Ascospores hyaline, spindle-shaped, straight, four–six-septate, 15–30 × 4–7(8) µm, with enlarged middle cell, and with visible perispore of 0.6–1.5 µm thick. Pycnidia scattered, sunken. Conidia straight or slightly curved, 3–4 × 1–1.5 µm (Fig. 34). Chemistry: thalli K-, C-, PD-.

Discussion. *Alyxoria varia* is easy to distinguish from other epiphytic species. Its diagnostic features are: the enlarged middle cell of ascospores, and the amyloid upper half of the inner layer of the endoascus.

Alyxoria varia is highly variable with respect to thallus color, morphology, and anatomy of the ascomata. Individual populations in Poland and other parts of Europe differ remarkably, not only in thallus color and size and shape of ascomata, but also in ascospore size. These features resulted in a taxonomic description of many varieties and forms of this species, including *O. lichenoides* for. *populina* (Mong.) A. Zahlbr., for. *confluens* (Massal.) A. Zahlbr., for. *cerebrina* (Erichs.) J. Nowak, for. *juglandis* (Massal.) A. Zahlbr., var. *nigrocaesia* Chev., var. *chlorina* (Pers.) Redgr., *O. pulicaris* for. *lignicola* (Harm.) A. Zahlbr., for. *minuta* (Chev.) Oliv., for. *incrusted* (God.) Oliv., for. *pollinii* (Massal.) Redgr., for. *phaea* (Ach.) Oliv., *O. diaphora* var. *diaphora*, for. *signata* (Ach.) J. Nowak, for. *tigrine* (Ach.) J. Nowak, for. *saprophila* (Nyl.) Oliv., var. *tridens* (Ach.) Oliv., var. *spurcata* (Ach.) Ach., for. *subgregaria* Harm., *O. rimalis* Pers. [10]. Its most frequent phenotype in Poland produces numerous circular to elliptic ascomata, with a conspicuous disc and thin excipulum edge. The discs shapes also are variable. Apothecia with flat, convex, and concave discs were observed. Moreover, in the examined material, convex discs were found to have wide and narrow ascomata. The number and types of pycnidia (Fig. 35) also were extremely variable. Similarly, the shape, length, and number of septa vary widely, but their variation is continuous and fits within the range of variability circumscribed for this species. Thus, attempts to identify a relationship between particular phenotypes and distinct taxa at lower ranks were unsuccessful.

Nomenclatural notes. The extreme morphological and anatomical variation of *Alyxoria varia* is due to its extensive geographic range. The variability resulted in a diverse circumscription of the species throughout its history. Considering its complicated taxonomic history, as well as the large numbers of varieties and forms of this species, it is challenging to identify correctly.

Difficulties with its classification probably result from different methods of taxonomic analysis and concepts used by different researchers. The taxon was regarded for a long time as a species aggregate, which could be divided into *Opegrapha lichenoides* (var. *nigrocaesia*, and *chlorina*), *O. pulicaris*, *O. rimalis*, *O. subrimalis*, and *O. diaphora* (var. *diaphora*, *tridens*, *spurcata*, and *angustata* Bouly de Lesd. [1]). For three nomenclatural synonyms (*O. lichenoides*, *O. pulicaris*, and *O. diaphora*), Nowak [10] compiled a list of as many as 22 heterotypic names of intraspecific taxa. Hawksworth et al. [62] excluded *O. pulicaris* from this group, as it was considered an allied fungus growing on lichens. Pentecost and Coppins [119] included only two names in the aggregate species: *O. lichenoides* and *O. varia* (synonyms: *O. diaphora* and *O. rimalis*). Clauzade and Roux [64] maintained that *O. varia* was a collective species. Torrente and Egea [34] attempted to clarify the classification of this group, but failed to find any relationships that determined limits of the taxonomic variation. Because of the discrepancies in systematic classification of this species, I used the concept of Santesson [63], such that all examined material was regarded as *A. varia*.

Distribution outside Europe. Widespread in North America [135–139]. Occasionally recorded from South America, Africa, and Asia. Reported from, e.g., Algeria [140], Argentina [141], the Bahamas [142], Brasil [143], Canada [66], China [144], Costa Rica [145], Hong Kong [146], India [147], Israel [148], Japan [149], Maldives [150], Morocco [65], in eastern Russia [151], Syria [152], Tunisia [88], Turkey [153–155], Uruguay [156,157], and the USA [135–139].

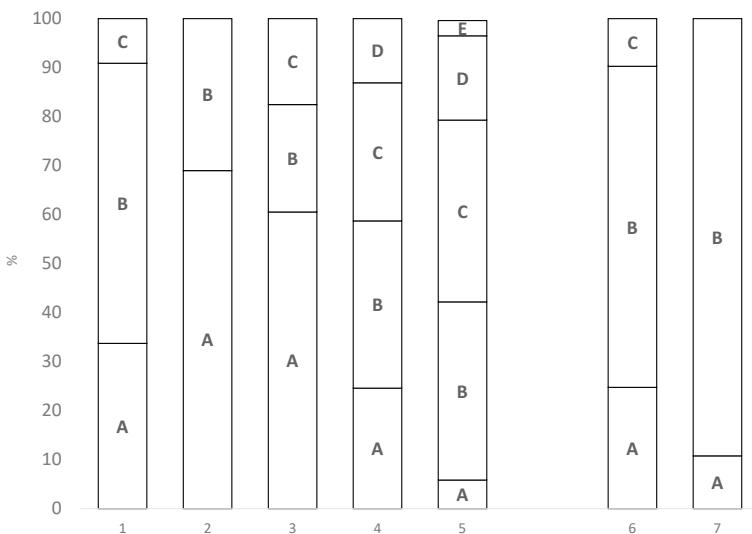

Fig. 35 Variation in selected morphological and anatomical features *Alyxoria varia*.
 1 – ascocarpi shape: A – circular, B – elliptic, C – elongate; 2 ascocarpi: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], *A. varia* has a Central European-Mediterranean and Atlantic distribution. In most European countries, it is usually found on the bark of deciduous trees, including *Carpinus betulus*, *Acer* spp., *Fagus sylvatica*, and *Fraxinus excelsior*. It was the least recorded from the bark of *Quercus* spp., and occasionally it was found on conifers. Like most of the species of the group, *Alyxoria varia* prefers moderately acidic to neutral substrates: pH 4.9–7.0 [38,39].

Widely distributed in Europe, reported, e.g., from Albania [158,159], Austria [71,160], Bulgaria [161], Cyprus [162], Denmark [163], Estonia [123,164], Finland [165], France [166,167], Germany [168–170], Greece [127], Hungary [93], Italy [171], Latvia [172], Lithuania [173–175], Malta [95], Montenegro [176], Norway [97], Portugal (Madeira [75,177]), Romania [178,179], Slovenia [76], Spain [99], Switzerland [129], and Ukraine [100,180,181].

Habitat and distribution in Poland. *Alyxoria varia* grows on the bark of various deciduous tree species in Poland, including old, well-preserved forests and moderately sunny sites. Most frequently, it can be found on *Fagus sylvatica*, *Acer* spp., *Fraxinus excelsior*, *Carpinus betulus*, and *Quercus* spp., but it is less frequently found on *Acer pseudoplatanus*, *Ulmus* spp., *Betula* spp., *Tilia* spp., and *Populus* spp. It is found also along streams and rivers (*Salix* spp.) and on roadside trees (*Acer* spp., *Aesculus hippocastanum*, etc.). Occasionally, it can be found on decaying wood, the bark of coniferous trees, and in sandstone.

In the nineteenth century, *Alyxoria varia* was described by Körber [21] and Stein [182], although they did not provide detailed localities. It also was reported without localities by Ohlert [77] and Lettau [78] from Prussia and Galicia [183–185]. During the last 100 years,

there have been a large number of reports of *A. varia* published in the Polish lichenological literature, but many of them are undocumented in the Polish herbaria.

The species was reported from: the Beskid Makowski Mountains [186], Beskid Mały Mountains [187], Beskid Niski Mountains [188], Beskid Śląski Mountains [189,190], Beskid Lesiste Mountains [191], Bieszczady Mountains [192,193], Bory Tucholskie (Tuchola Forest) [194,195], Dolina Dolnego Sanu (Lower San River Valley) [104], Dolina Konińska (Konin Valley) [196], Dolny Śląsk (Lower Silesia Province) [132], Gorce Mountains [197], Stołowe Mountains [198], Świętokrzyskie Mountains [105,199–201], Karkonosze Mountains [202], Carpathians [203,204], Kotlina Biebrzańska (Biebrza Basin) [205], Kotlina Toruńska (Toruń Basin) [206], Kotlina Żywiecka (Żywiec Basin) [207], Łąćuch Tatrzanski macroregion [107,208–211], Małopolski Przełom Wisły (Lesser Poland Gorge of the Vistula) [212], Masyw Ślęży (Ślęza Massif) [213,214], Mierzeja Wiślana (Vistula Spit) [215], Niecka Włoszczowska (Włoszczowa Basin) [216], Nizina Mazowiecka (Mazovian Lowland) [217], northeastern Poland [218], Pieniny Mountains [111,219], Płaskowyż Nałęczowski (Nałęczów Plateau) [220], Pobrzeże Kaszubskie (Kashubian Coastland) [79,221], Pobrzeże Szczecińskie (Szczecin Coastland) [222], Podgórze Rzeszowskie (Rzeszów Foothills) [223], Podhale [224], Pogórze Rożnowsko-Ciężkowickie (Rożnowsko-Ciężkowickie Foothills) [81], Pogórze Spiskie (Spisz Foothills) [225], Pojezierze Choszczeńskie (Choszczno Lake District) [226], Pojezierze Gnieźnieńskie (Gniezno Lake District) [227–229], Pojezierze Iławskie (Iława Lake District) [230,231], Pojezierze Kaszubskie (Kashubian Lake District) [232], Pojezierze Krajeńskie (Krajna Lake District) [233], Pojezierze Mrągowskie (Mrągowo Lake District) [234], Pojezierze Olsztyńskie (Olsztyń Lake District) [235,236], Pradolina Wieprza (Wieprz River Urstromtal) [237], Pradolina Wrocławska (Wrocław Urstromtal) [238], Równina Augustowska (Augustów Plain) [239–242], Równina Bielska (Bielsk Plain) [55,243], Równina Drawska (Drawno Plain) [244], Równina Kozienicka (Kozienice Plain) [245,246], Równina Łęczyńsko-Włodawska (Łęczna-Włodawa Plain) [247,248], Równina Łowicko-Błońska (Łowicz-Błonie Plain) [249], Równina Łukowska (Łuków Plain) [250,251], Równina Piotrkowska (Piotrków Plain) [252,253], Równina Słupska (Słupsk Plain) [86], Roztocze [254–258], Sudetes [259–261], Śląsk Opolski (Opole Silesia) [262], West Beskids [131,190,191], Western Pomerania [56,263,264], Wybrzeże Słowińskie (Slovincian Coast) [265,266], Wysoczyzna Bełchatowska (Bełchatów Highland) [267,268], Wysoczyzna Białostocka (Białystok Highland) [269–272], Wysoczyzna Elbląska (Elbląg Highland) [273], Wysoczyzna Kaliska (Kalisz Highland) [274,275], Wysoczyzna Łaska (Łask Highland) [276], Wysoczyzna Siedlecka (Siedlce Highland) [277], Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland) [278], Wyżyna Sandomierska (Sandomierz Upland) [279], Wyżyna Wieluńska (Wieluń Upland) [280], Wzgórza Radomszczańskie (Radomsko Hills) [216], Wzniesienia Mławskie (Mława Hills) [281], and Zakłębłość Sosnowicka (Sosnowica Depression) [282].

Throughout Poland, 334 specimens were located in the lowlands and mountains (Fig. 36). A majority of its known localities are in the West Carpathians and East Beskids. It has been reported from the Western Tatras by Tobolewski at 1,150 m in altitude [209]. In the Sudetes, it is known from a few localities. Outside the mountainous regions, it is frequent in the East Baltic-Belorussian Lowlands on phorophytes in extensive, dense woodlands. In northern Poland, it was scattered in the Pojezierze Południowobałtyckie (South Baltic Lakeland) and Pobrzeże Południowobałtyckie (South Baltic Coastland). In other parts of the country, it was observed more often in the eastern Nizina Środkowopolska (Central Poland Lowland). In the western part of the country, it was recorded only occasionally.

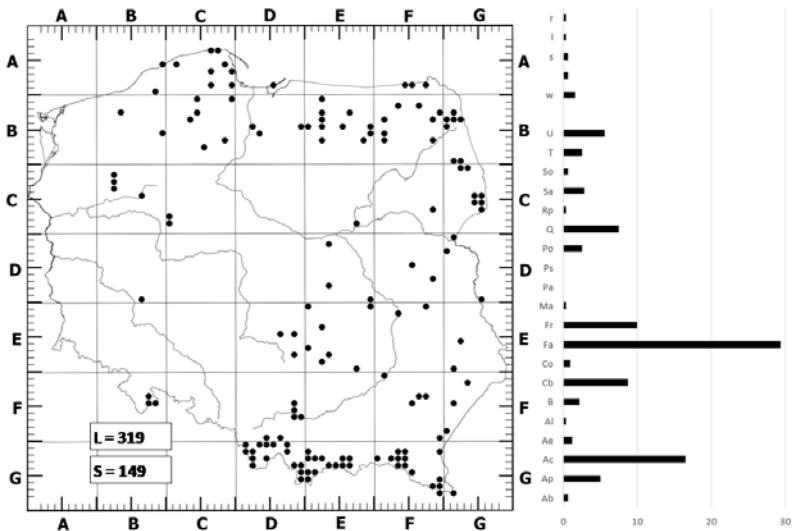

Fig. 36 Distribution and substrate preference of *Alyxoria varia* in Poland.

4.6.5. *Arthonia atra* (Pers.) A. Schneid.

Guide Study Lich.: 131 (1898).

≡ *Opegrapha atra* Pers., Ann. Bot. (Usteri) 7: 30 (1794).

Thallus thin, external, smooth or cracked, ranging in color from white and white-grey to brown. Ascomata numerous, solitary or clustered, unbranched or branched, sometimes forming large and continuous patches, fused terminally, 0.1–0.8 mm long and 0.1–0.3 mm wide. Discs concave (groove-like), flat or, more often, convex, central part rarely ± wider (trough-like), black, not pruinose, 13–133 µm wide. Excipulum relatively thick, elevated, permanent, black, naked, continuous below the hypothecium, rarely discontinuous, 20–40 µm thick laterally and 30–60 µm at the base. Hypothecium 12–25(30) µm high, K–. Hymenium hyaline, 30–60 µm high, I+ blue. Pseudoepithecium brownish, 6–14 µm high, K–. Ascii 30–50 × 10–15 µm, *calcarea*-type. Ascospores hyaline, ellipsoid, three-septate, 13–17(20) × 4–6 µm, with perispore of 0.4–0.6 µm thick. Pycnidia frequent, black, usually convex, 17–68 µm in diameter. Conidia straight or curved, 3.5–5 × 0.5–1.5 µm (Fig. 37). Chemistry: thalli K–, C–, PD–.

Discussion. *Arthonia atra* is characterized by short ascospores (up to 17 µm), a thin perispore (0.4–0.6 µm), *calcarea*-type ascii, and a short conidium (3.5–5 µm). According to Nowak [10], this species is most similar to *Alyxoria culmigena* (= *O. herbarum*) and *Pseudoschismatomma rufescens* (= *O. rufescens*). However, its ascospores are shorter than in *A. culmigena*, slightly wider than in *P. rufescens*, and have a conspicuous but thin perispore. Moreover, in contrast to the *vulgata*-type ascii in *P. rufescens* and the *varia*-type ascii in *A. culmigena*, *A. atra* produces *calcarea*-type ascii. Another species that can be confused with *A. atra* is *Alyxoria ochrocheila*. Both species have ascospores of similar size and with perispores, but *A. ochrocheila* has conidia that are much longer and two–three-septate.

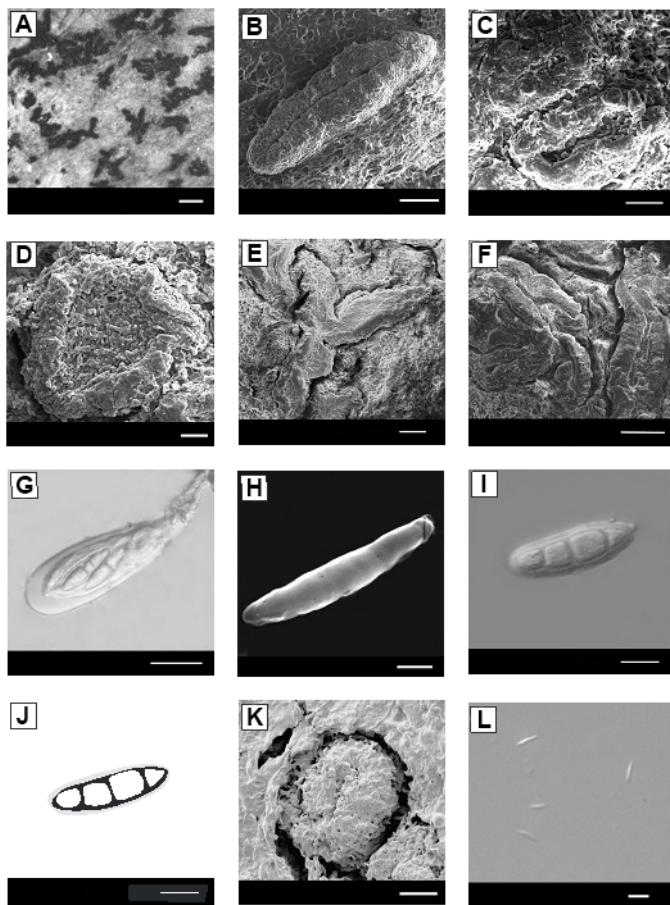

Fig. 37 *Arthonia atra* (Pers.) A. Schneid.: (A) thallus and ascomata, LM (leg. S. Cieśliński, 1993, KTC); (B–F) thallus and ascomata, SEM [(B,D,E) leg. S. Cieśliński, 1985, KTC; (C) leg. S. Cieśliński, 1993, KTC]; (G) ascus with ascospores, LM (leg. A. Wieczorek, 2002, herb. Wieczorek); (H) ascospore, SEM (leg. S. Cieśliński, 1985, KTC); (I,J) ascospores, LM (leg. A. Wieczorek, 2002, herb. Wieczorek); (K) pycnidium, SEM (leg. Z. Tobolewski, 1951, POZ); (L) conidia, LM (leg. A. Wieczorek, 1996, herb. Wieczorek). Scale bars: (A) 2 mm; (B,C,E,F) 100 µm; (D) 50 µm; (G,J) 10 µm; (H) 2 µm; (I) 5 µm; (K) 250 µm; (L) 3 µm.

Arthonia atra is phenotypic plastic among individuals, depending on changing environmental conditions. In total, 24 intraspecific taxa have been described within *A. atra*, and their names are regarded as synonyms. Based on the shape of their ascomata, Nowak [10] distinguished 11 forms of *O. atra* [for. *atra* – *O. cerasi* Chev., for. *fibricola* B. de Lesd., for. *reticulata* (DC.) J. Nowak, for. *rimosa* (DC.) J. Nowak, for. *denigrata* (Ach.) Leight., for. *stenocarpa* (Ach.) – *O. stenocarpa* Ach., for. *arthonioidea* (Leight.) Leight., for. *nigrita* Leight., for. *platanoides* Nyl., for. *stellulata* Mereschk., for. *orbicularis* B. de Lesd.], including two new ones described from Poland (for. *reticulata* and for. *rimosa*). However, these forms do not appear to deserve separate taxonomic rankings, as the character variation is continuous throughout all examined

material, with many specimens having intermediate features and parameters. In the analyzed material, the ascocarps usually were elliptic or elongate, and circular ascocarps were very rare (Fig. 38). The ascocarp length ranged from 154 µm to 797 µm. Their distribution was scattered or clumped (with similar frequency). The examined specimens had flat or slightly convex discs, rarely concave. In addition to the size and shape of their ascocarps, the color of the thalli also varied. They usually contain abundant, convex pycnidia, but the shape of conidia was variable. They usually were slightly curved, but sometimes the same specimen showed both straight and curved conidia.

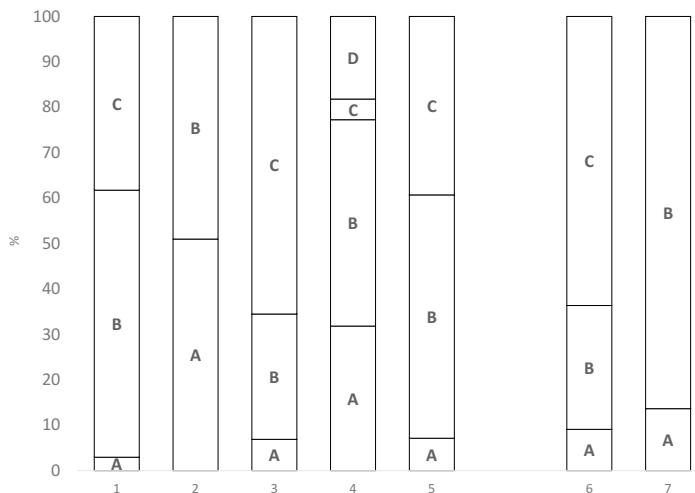

Fig. 38 Variation in selected morphological and anatomical features *Arthonia atra*.

1 – ascocarp shape: A – circular, B – elliptic, C – elongate; 2 – ascocarp: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Nomenclatural notes. The taxon was first described by Persoon in 1794 [283], who named it *Opegrapha atra*. It is noteworthy that Schneider in 1898 [284] was the first to call it *Arthonia atra*, but this name was not commonly used. However, according to the latest taxonomic classification [6], the genus *Arthonia* in the order Arthoniales is confirmed. Previously, *O. calcarea* was included in *Arthonia* as well [6] due to the different structure of their asci [34]. This conclusion is confirmed by the present study. The genus *Arthonia* is a heterogeneous group of lichens [33,285] that now contains about 400 species, the largest genus in the order Arthoniales [286].

Distribution outside Europe. Species with a wide geographic range. Recorded from North America (Canada [66], Alabama [287], the Bahamas [142], Florida [139], Louisiana [138], New York [288], South Carolina [289], Wisconsin [290]), Bermudas [291]), in South America (Argentina [141]), in Africa (Lebanon [292], Morocco [65], Tunisia [88]), and in Oceania [293].

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], *Arthonia atra* is a boreal-Mediterranean, sub-Atlantic species. It grows on the bark of various deciduous tree species, but is less often found on conifers. It is most frequently found on *Carpinus betulus*, *Fagus sylvatica*, *Quercus* spp., and *Acer* spp., but less frequently on the bark of *Fraxinus excelsior*, *Abies* spp., and *Picea* spp. Only occasionally is it found on *Pinus* spp. This species usually colonizes moderately acidic substrates, with pH 4.9–5.6 [38].

In Europe, it is known from numerous localities, reported, e.g., from Albania [294], Austria [71], the Czech Republic [295], Denmark [122,163], Estonia [123], Finland [165], France [166], Germany [124,168,170,296–300], Great Britain [92], Greece [127], Hungary [93], Ireland [94], Italy [74,171], Latvia [172], Lithuania [173], Macedonia [301], Malta [95], the Netherlands [96], Norway [97], Portugal (Madeira [75]), Romania [302], Slovenia [76], Spain [99], Sweden [97], Switzerland [129], Turkey [153–155], and Ukraine [100].

Habitat and distribution in Poland. In Poland, *Arthonia atra* grows commonly on the bark of deciduous trees, including *Fagus sylvatica*, *Quercus* spp., *Fraxinus excelsior*, *Acer pseudoplatanus*. It can be found less often on *Acer* spp., *Carpinus betulus*, or *Salix* spp., and very rarely on *Betula* spp., *Corylus avellana*, *Populus* spp., and *Ulmus* spp. Nowak [10] reported it on coniferous trees, including twigs of *Myrica gale*, and on decaying wood.

Most *A. atra* localities are found in northern Poland, while several isolated specimens can occur in central Poland. Additionally, the species was recorded from the Sudetes and Carpathians (Fig. 39).

The first record of *A. atra* was published by Körber [21]. It was also reported by Ohlert [77], Stein [182], Eitner [303], Lettau [78], Boberski [183–185]. Later, the species was many times reported in the Polish lichenological literature from: the Beskid Sądecki Mountains [103], Beskid Lesiste Mountains [191], Bory Tucholskie (Tuchola Forest) [194,195], Dolny

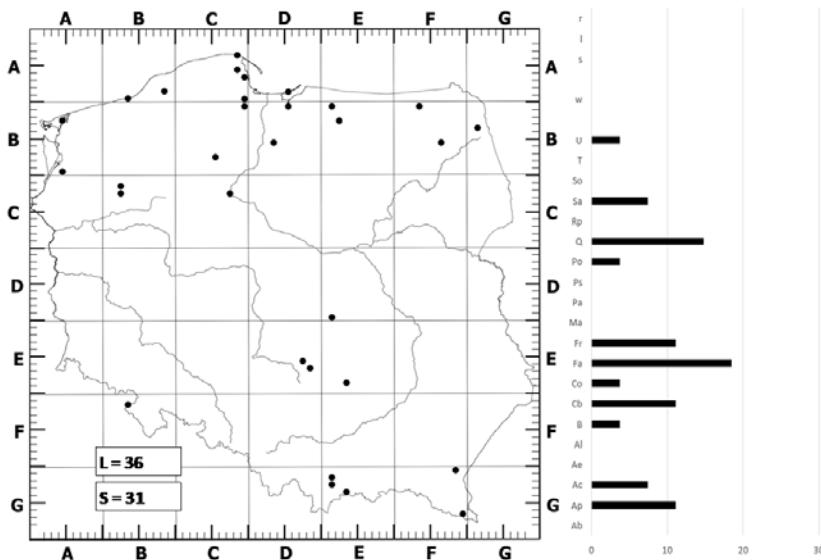

Fig. 39 Distribution and substrate preference of *Arthonia atra* in Poland.

Śląsk (Lower Silesia Province) [132], Gorce Mountains [197], Stołowe Mountains [198], Świętokrzyskie Mountains [105,199–201], Kotlina Biebrzańska (Biebrza Basin) [205], Kotlina Toruńska (Toruń Basin) [206], Łącuch Tatrzański macroregion [107,208], Małopolski Przełom Wisły (Lesser Poland Gorge of the Vistula) [212], Masyw Ślęży massif [213,214], Niecka Włoszczowska basin [216], Pieniny Mountains [111,219], Płaskowyż Nałęczowski (Nałęczów Plateau) [220], Pobrzeże Kaszubskie (Kashubian Coastland) [79,221,304], Pobrzeże Szczecińskie (Szczecin Coastland) [80,222], Podgórze Rzeszowskie (Rzeszów Foothills) [223], Pogórze Przemyskie (Przemyśl Foothills) [112], Pojezierze Ełckie (Ełk Lakeland) [305], Pojezierze Gnieźnieńskie (Gniezno Lake District) [227], Pojezierze Iławskie (Iława Lake District) [230], Pojezierze Kaszubskie (Kashubian Lake District) [83,232], Pojezierze Krajeńskie (Krajna Lake District) [233], Pojezierze Mrągowskie (Mrągowo Lake District) [234], Pradolina Wieprza (Wieprz River Urstromtal) [237], Pradolina Wrocławska (Wrocław Urstromtal) [238], Równina Augustowska (Augustów Plain) [240–242,306,307], Równina Bielska (Bielsk Plain) [55], Równina Biłgorajska (Biłgorajska Plain) [308], Równina Drawska (Drawno Plain) [85,244], Równina Łęczyńsko-Włodawska (Łęczna-Włodawa Plain) [247,248], Równina Łukowska (Łuków Plain) [250,251], Równina Piotrowska (Piotrków Plain) [252,253], Roztocze [254–258], Sudetes [260,261], Śląsk Opolski (Opole Silesia) [262], West Beskids [190,191], West Bieszczady Mountains [309], Western Pomerania [56,263,264], Wzgórza Radomszczańskie (Radomsko Hills) [216], Wybrzeże Słowińskie (Slovincian Coast) [266], Wysoczyzna Białostocka (Białystok Highland) [269–272], Wysoczyzna Elbląska (Elbląg Highland) [273], Wysoczyzna Kaliska (Kalisz Highland) [274], Wysoczyzna Łaska (Łask Highland) [276], Wysoczyzna Siedlecka (Siedlce Highland) [277], Wyżyna Lubelska (Lublin Upland) [87], and Zaklesłość Sosnowicka (Sosnowica Depression) [282].

Most of *A. atra* localities are placed in northern Poland, while several isolated ones are in central Poland. Additionally, the species was recorded from the Sudetes and Carpathians (Fig. 39).

4.6.6. *Arthonia calcarea* (Turner ex Sm.) Ertz & Diederich

in Ertz, Miądlikowska, Lutzoni, Dessein, Raspe, Vigneron, Hofstetter & Deiderich, Mycol. Res. 113(1): 146 (2009).

≡ *Opegrapha calcarea* Turner ex Sm., in Smith & Sowerby, Engl. Bot. 25: Tab. 1790 (1807).

= *Opegrapha chevallieri* Leight., Ann. Mag. Nat. Hist., Ser. 213: 90 (1854).

Thallus thin, white. Ascomata black, not pruinose, elevated, solitary or in small groups, unbranched or branched, 0.3–1.2 × 0.15–0.3 mm. Discs narrow, reduced to a crevice, concave, 15–35 µm wide. Excipulum thick, elevated, permanent, black, naked, continuous below the hypothecium, 20–35 µm thick laterally and 30–45 µm at the base. Hypothecium grey-brown, 15–25 µm high. Hymenium 40–70 µm high, I+ blue. Pseudoepithecum hardly visible. Ascii club-shaped, 35–50 × 15–20 µm, inner layer of endoascus slightly amyloid, limited to the dome zone (*calcarea*-type). Ascospores hyaline, ellipsoid, three-septate, (13)15–18 × 4–6 µm, with perispore of 0.5 µm thick, sometimes hardly visible. Pycnidia sunken in thallus, rarely convex, conidia straight 5–8 × 0.8–1(1.2) µm (Fig. 40). Chemistry: thalli K–, C–, PD–.

Discussion. *Arthonia calcarea* can be distinguished from other epilithic taxa found in Poland primarily by its longer conidia, the presence of an amyloid layer around the ascus, and based on

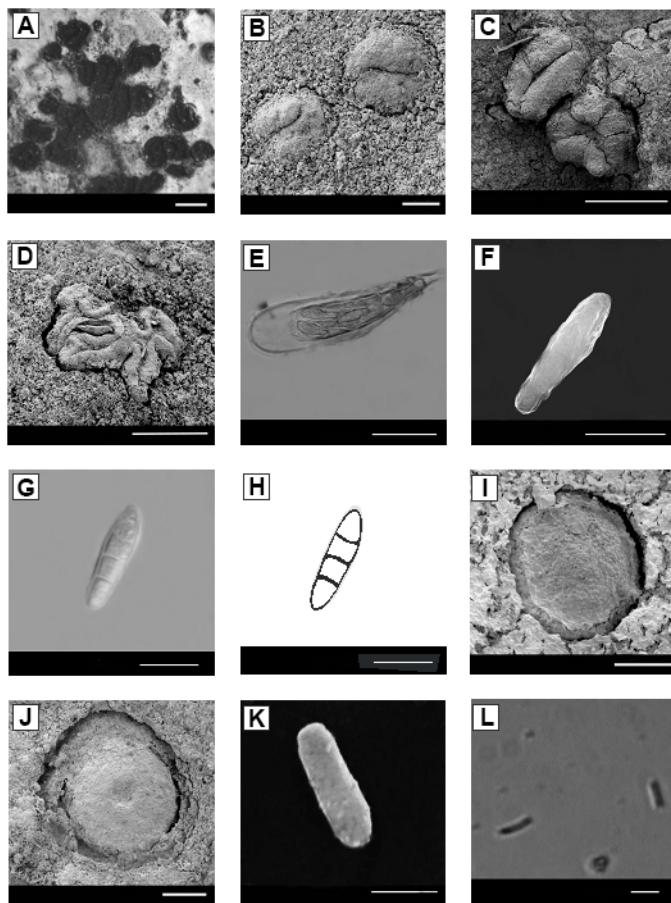

Fig. 40 *Arthonia calcarea* (Turner ex Sm.) Ertz & Diederich: (A) thallus and ascomata, LM (leg. A. Wieczorek, 1997, herb. Wieczorek); (B–D) thallus and ascomata, SEM [(B) leg. A. Wieczorek, July 20, 1997, herb. Wieczorek; (C) s. coll., KRAM-L 27263; (D) s. coll., KRAM-L 26972]; (E) ascus with ascospores, LM (s. coll., KRAM-L 27263); (F) ascospores, SEM (leg. A. Wieczorek, 1997, herb. Wieczorek); (G,H) ascospores, LM (s. coll., KRAM-L 27263); (I,J) pycnidium, SEM (s. coll., KRAM-L 27263); (K) conidium, SEM (leg. A. Wieczorek, 1997, herb. Wieczorek); (L) conidia, LM (leg. A. Wieczorek, 1997, herb. Wieczorek). Scale bars: (A,B) 200 µm; (C,D) 300 µm; (E) 20 µm; (F–H) 10 µm; (J) 50 µm; (K) 3 µm; (L) 5 µm.

the structure of the apical apparatus. Identification on the basis of other anatomical structures can be difficult. Ascospore size and shape are similar to those in *Opegrapha saxicola* Ach, particularly for individuals that develop a visible perispore. However, perispore's thickness in *A. calcarea* does not exceed 1 µm, but mature, well-developed spores of *O. saxicola* contain thicker perispores. *Arthonia calcarea* differs from *O. dolomitica* by having ascospores shorter than 20 µm.

Since *Arthonia calcarea* is rare in Poland and there are few herbarium specimens, it is difficult to assess its intraspecific variability. Most populations vary primarily in shape of the ascocarps. In some individuals, the ascocarps are circular, solitary, unbranched, and resemble those in *Opegrapha dolomitica*. Occasionally, the ascocarps are ellipsoid to elongate. Only concave discs were observed in the studied specimens. The ascocarps with two types of excipulum were observed: Types A and B. Usually, there are few pycnidia, both sessile and convex (Fig. 41). Perispore thickness also is variable in ascospores. In some individuals, it is reduced and poorly developed, whilst in others, it is narrow but well defined.

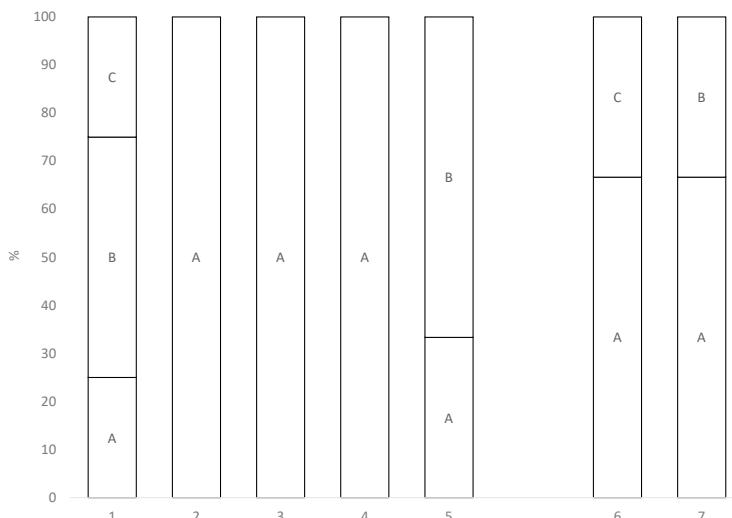

Fig. 41 Variation in selected morphological and anatomical features of *Arthonia calcarea*. 1 – ascocarp shape: A – circular, B – elliptic, C – elongate; 2 – ascocarps: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Nomenclatural notes. *Opegrapha calcarea* was described by Smith and Sowerby [310]. The name was taken from Turner's manuscripts, who described the species from "the mortar of old walls in Norfolk and Suffolk". The name was accepted by Acharius [2,3]. Stizenberger [4] proposed a different approach and regarded this species, with other epilithic lichens (*O. trifurcata* Hepp and *O. chevallieri*), as synonymous with *O. atra*, on the basis of similar ascospore shape and size. His approach, however, was not accepted by a majority of lichenologists, who continued using the name *O. calcarea* [1,116,311–313].

Considering ascospore dimensions, Pentecost and Coppins [119] as well as Purvis et al. [40] treated *A. calcarea* as an ecotype of *Opegrapha saxatilis*. However, according to Clauzade and Roux [64], *O. saxatilis* has a discontinuous excipulum below the hypothecium, therefore the species cannot be treated as synonyms.

Detailed studies on this species were conducted by Torrente and Egea [34], who compared three similar, closely related species (*O. calcarea*, *O. chevallieri*, and *O. trifurcata*). They pointed out that the three species are conspecific and represent *O. calcarea*. Smith et al. [41] deviated from their earlier classification by assuming that *O. saxatilis* was a synonym of *O. calcarea*, and they took into account other morphotypes of this taxon, including *O. conferta* and *O. chevallieri*.

The treatment of *Arthonia calcarea* as a separate species is justified by the characteristic ascus type and the continuous excipulum below the hypothecium. This was confirmed by Clauzade and Roux [64], Torrente and Egea [34], and by the results of my research.

Distribution outside Europe. It was recorded from North America (Canada [66], the Bahamas [142]), in Asia (Taiwan [69], Armenia [120]), and in North Africa (Morocco [65] and Tunisia [88]). Moreover, it has been reported from the Canary Islands [314].

Habitat and distribution in Europe. According to Smith et al. [41], the species distribution is Central European-Mediterranean and sub-Atlantic. In Europe, it is found on calcareous rocks and occasionally sandstone. According to Torrente and Egea [34], they are observed in Western Europe mostly in coastal zones, but they are known also from a few localities in Central Europe, including Styria in Austria [160].

The species was reported, e.g., from Austria [71], Cyprus [162], Denmark [122,163], Germany [91,168,298,299], Greece [315], Hungary [93], Italy [74], Montenegro [316], Norway [97], Portugal (Madeira [75]), Slovenia [76], Spain [99], and Ukraine [100].

Habitat and distribution in Poland. Like most of the epilithic species, *Arthonia calcarea* grows on rocks of various types (limestone and dolomite, rarely sandstone), usually on dry, sunny, vertical sites. The various local climates and microclimates associated with the varied relief of mountainous terrain, likely provide favorable conditions for this species. *Arthonia calcarea* was reported for the first time by Eitner [303] in the Sudetes. It was later reported from the Łąćuch Tatrzański macroregion [106,107], Sudetes [260], and Dolny Śląsk (Lower Silesia Province) [132].

Only two contemporary collections were available to study and they both originated from the Carpathians (Fig. 42). However, the KRAM herbarium includes three specimens (one dating back to 1847), with no location or author given.

4.6.7. *Gyrographa gyrocarpa* (Flot.) Ertz & Tehler

in Ertz, Tehler, Irestedt, Frisch, Thor & van den Boom, Fungal Diversity 70: 42 (2015).

≡ *Opegrapha gyrocarpa* Flot., Flora, (Regensburg) 8: 345 (1825).

Thallus with very characteristic, yellowish soralia, poorly developed, often forming larger aggregations. Ascomata rare, if present, usually circular to ellipsoid, solitary or in groups, very rarely branched, 0.5–2.0 mm in diameter. Discs strongly wrinkled, sometimes limited from the center with a roundish ridge or irregularly twisted, black, not pruinose. Excipulum thick, permanent, undulated or convoluted, black, naked, dull or slightly shiny, brittle, continuous below the hypothecium, up to 500 µm thick at the base, K+ olive-green. Hypothecium pale to nearly hyaline, 20–25 µm high. Hymenium hyaline, ca. 100 µm high, I+ reddish. Pseudoepitheciun

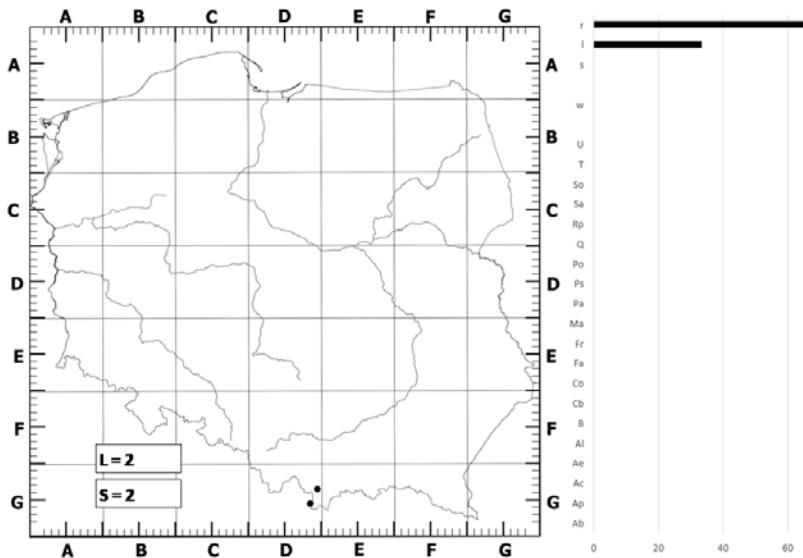

Fig. 42 Distribution of *Arthonia calcarea* in Poland.

inconspicuous. Ascii club-shaped or cylindrical, $80–90 \times 12–15 \mu\text{m}$. Ascospores hyaline, narrowly spindle-shaped, three-septate, $20–26 \times 3–5 \mu\text{m}$, without perispore. Pycnidia scattered, sunken, visible as very small, blackish dots. Conidia straight, $5–6 \times 0.3–0.5 \mu\text{m}$ (Fig. 43). Thallus K–, C+ reddish, KC+ reddish (mainly the inner part and soralia are stained), PD–. Three chemotypes were described by Tønsberg [317].

Discussion. In Poland, *Gyrographa gyrocarpa* is the most distinctive species among the epilithic representatives of the group. It rarely is confused with other species. Due to the characteristic soredia, it easily can be identified, even when sterile. In addition to the color reaction of the soredia, it differs from other species in the following characteristics: (i) large (but not always present), nearly circular or irregular ascomata and (ii) three-septate ascospores without perispore.

The species is usually sterile. In the sterile form, it is similar to *Enterographa zonata*, but it differs in the color reaction of the medulla and soredia (C+ and KC+ reddish). In some localities (e.g., in the Sudetes), *G. gyrocarpa* produces numerous ascomata. Like in other taxa of the genus *Opegrapha* s. l., the ascomata are variable, usually elliptic or circular, very rarely elongate. They usually are solitary, producing various types of discs from concave to flat or convex. The species is variable in thallus color and in the abundance of pycnidia (Fig. 44).

Nomenclatural notes. *Gyrographa gyrocarpa* was described in 1825 as *Opegrapha gyrocarpa* [318]. Previously, two varieties were distinguished: var. *arenaria* Körber [319] and var. *schisticola* (Eitn.) Migula [313]. The genus *Gyrographa* was described by Ertz et al. [9]. In the earlier literature, polymorphic characters were noted by Tønsberg [317], and it was even suggested that the species should be moved to the related genus *Lecanactis* [57].

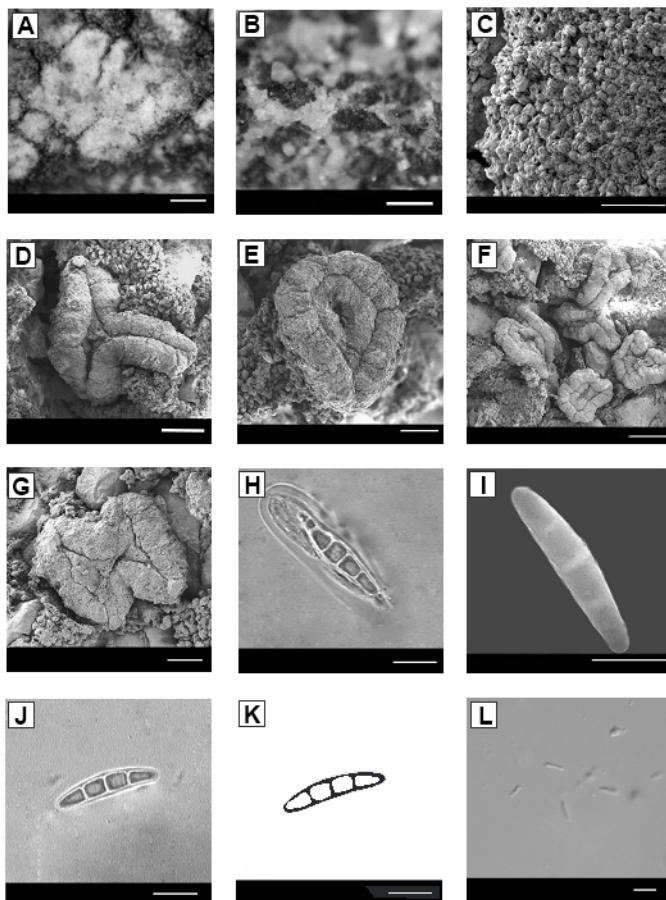

Fig. 43 *Gyrographa gyrocarpa* (Flot.) Ertz & Tehler: (A,B) thallus and ascocarps, LM (leg. M. Kossowska, 2008, herb. Kossowska); (C–G) thallus and ascocarps, SEM [(C–E) leg. K. Szczepańska, 2003, herb. Szczepańska; (F,G) leg. P. Czarnota, GPN 2145]; (H) ascus with ascospores, LM (leg. Z. Tobolewski, 1960, POZ); (I) ascospore, SEM (leg. K. Szczepańska, 2003, herb. Szczepańska); (J,K) ascospores, LM (leg. A. Wieczorek, 1989, herb. Wieczorek); (L) conidia, LM (leg. A. Wieczorek, 1989, herb. Wieczorek). Scale bars: (A,C,E,G) 100 µm; (B) 500 µm; (D) 200 µm; (F) 250 µm; (H–K) 10 µm; (L) 5 µm.

Distribution outside Europe. Species with a wide geographic range, including North America, e.g., Canada [66], and part of Asia, e.g., Japan [149].

Habitat and distribution in Europe. According to Wirth [38], Wirth et al. [39], and Purvis et al. [40], the species distribution is boreal-Central European and sub-Atlantic. It is most frequently found on sandstone and granite.

In Europe it is known, e.g., from Austria [71,160], the Czech Republic [295], Finland [165], Germany [124–126,168,170,320], Great Britain [92], Italy [74], the Netherlands [96],

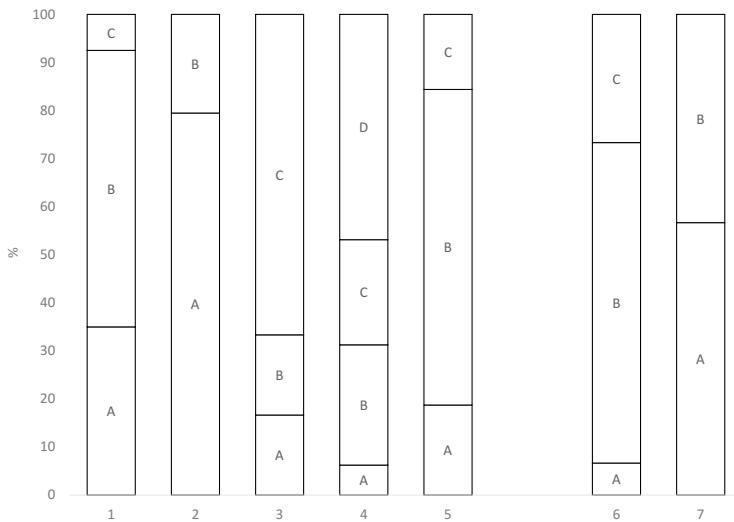

Fig. 44 Variation in selected morphological and anatomical features *Gyrographa gyrocarpa*. 1 – ascocarata shape: A – circular, B – elliptic, C – elongate; 2 – ascocarata: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Norway [97], Portugal (Madeira, Azores [75,98]), Romania [302], Slovenia [76], Spain [99], and Sweden [97].

Habitat and distribution in Poland. *Gyrographa gyrocarpa* can be found on rocks of woodlands located in valleys and gorges, and on vertical or hanging rocks that are dry or moist, with north or northeastern exposure. They are less often found in open or sunny habitats.

The first record of *Gyrographa gyrocarpa* was published by Körber [21]. It was also recorded by Stein [182] and Eitner [303], but it was erroneously reported from calcareous rocks in some southern parts of Poland.

It was later reported in the Polish lichenological literature from the Beskid Mały Mountains [321], Beskid Niski Mountains [322], Beskid Sądecki Mountains [102,103,323], Beskid Śląski Mountains [190], Beskidzkie Lesiste (Wooded Beskids) [191], Gorce Mountains [324], Stołowe Mountains [198], Sowie Mountains [325], Karkonosze Mountains [326,327], Łąćuch Tatrzański macroregion [107,210], Pogórze Rożnowsko-Cieżkowickie (Rożnowsko-Cieżkowickie Foothills) [81], Sudetes [261,328], West Beskids [329], West Bieszczady Mountains [309].

Gyrographa gyrocarpa was recorded exclusively from the southern part of Poland (Fig. 45), with a center of distribution in the Polish Carpathians. It can also be found in the West Beskids and Beskidzkie Lesiste. It is more rare to find it in the Sudetes, Karkonosze Mountains, and Stołowe Mountains.

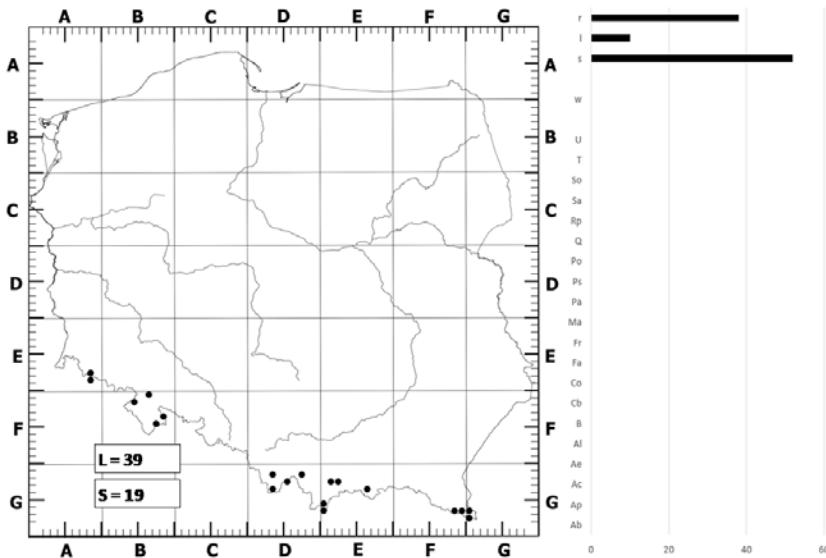

Fig. 45 Distribution and substrate preference of *Gyrographa gyrocarpa* in Poland.

4.6.8. *Opegrapha dolomitica* (Arnold) Clauzade & Cl. Roux ex Torrente & Egea

Bibliotheca Lichenol. 32: 146 (1989).

≡ *Opegrapha rupestris* var. *dolomitica* Arnold, Flora (Regensburg) 43: 78 (1860).

≡ *Opegrapha saxicola* var. *dolomitica* (Arnold) V. Wirth, Flechtenflora (Stuttgart): 531 (1980).

Thallus grey to grey-white, sometimes with black prothallus. Ascomata elliptic, sometimes curved and branched in maturity, $0.2\text{--}0.8 \times 0.4\text{--}0.8$ mm, solitary or in groups of various size; surface not pruinose, protrude above the thallus, very rarely sunken. Discs black, narrow, rarely broad. Excipulum thick, permanent, black, naked, continuous below the hypothecium, 40–60 μm thick laterally and 80–150 μm at the base. Hypothecium grey to grey-brown, dark, 20–25 μm high. Hymenium 50–70 μm high, I+ reddish. Pseudoepitheciellum brown, K-. Ascii broadly club-shaped, mature $60\text{--}70 \times 19\text{--}22$ μm , young $45\text{--}57 \times 16$ μm , inner layer of endoascus amyloid in upper part, ring and ocular chamber reduced (*varia*-type). Ascospores hyaline, ellipsoid, three-septate, $(18)22\text{--}29 \times 5\text{--}6$ μm , with perispore of $0.5\text{--}0.7(1.0)$ μm thick. Pycnidia elevated or sessile, black. Conidia straight, $4\text{--}6 \times 0.5\text{--}1$ μm (Fig. 46). Chemistry: thalli K-, C-, PD-.

Discussion. *Opegrapha dolomitica* can be distinguished from the similar *Opegrapha saxicola* by its markedly longer ascospores, which are more than 22 μm long, with a thin hyaline perispore. *Opegrapha dolomitica* differs from *Gyrographa gyrocarpa* by the presence of a perispore and the lack of a color reaction on the thallus.

Most populations of *O. dolomitica* vary in size and shape of the ascomata. In some specimens, all of the ascomata were elliptic, unbranched, and elevated. In others, the ascomata were branched and meandering. However, in some specimens, a broad range of shape variation was observed. For this reason, like in other *Opegrapha* species, the shape and size of the ascomata

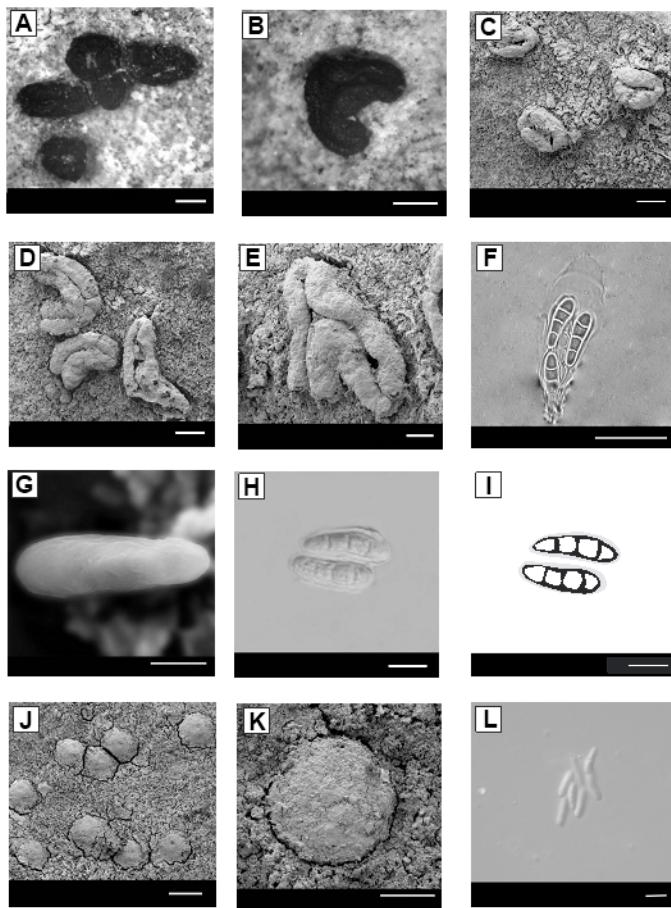

Fig. 46 *Opegrapha dolomitica* (Arnold) Clauzade & Cl. Roux ex Torrente & Egea: (A,B) thallus and ascomata, LM [(A) leg. J. Nowak, KRAM-L 12158; (B) leg. J. Nowak, KRAM-L 9661]; (C–E) thallus and ascomata, SEM [(C,E) leg. J. Nowak, KRAM-L 30447; (D) leg. J. Nowak, KRAM-L 12158]; (F) ascus with ascospores, LM (leg. J. Nowak, KRAM-L 30447); (G) ascospore, SEM (leg. J. Nowak, KRAM-L 30447); (H,I) ascospores, LM (leg. J. Nowak, KRAM-L 30447); (J,K) pycnidia, SEM (leg. J. Nowak, KRAM-L 30447); (L) conidia, LM (leg. J. Nowak, KRAM-L 30447). Scale bars: (A,B,D,E,K) 100 µm; (C) 150 µm; (F,G) 25 µm; (H,I) 10 µm; (J) 250 µm; (L) 5 µm.

cannot be regarded as a good diagnostic feature. Disc type also is variable within populations and on individual specimens. They have an excipulum of Type C, but A or B may be found occasionally. The pycnidia are numerous, sessile, and convex (Fig. 47).

Nomenclatural notes. *Opegrapha dolomitica* is one of the newest species of this genus to be distinguished at the species rank [34]. Stizenberger [4] wrote “a frequently noticeable form of this species (*O. saxicola*) is *dolomitica* Arn., but I do not attempt to establish its

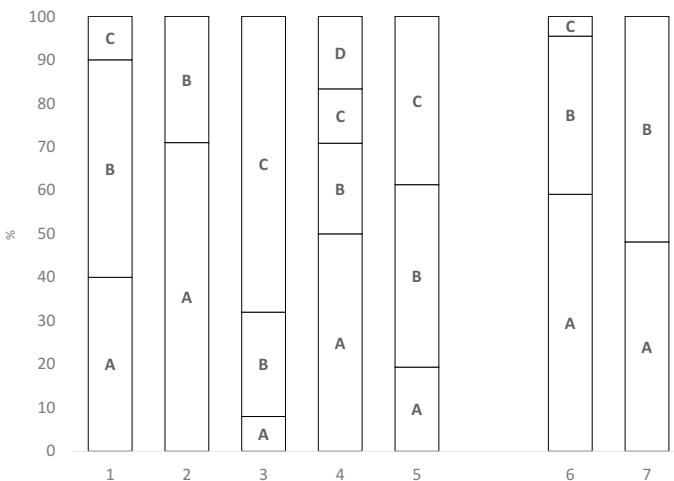

Fig. 47 Variation in selected morphological and anatomical features *Opegrapha dolomitica*. 1 – ascocarps shape: A – circular, B – elliptic, C – elongate; 2 – ascocarps: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – cross section of a typical ascocarp: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

systematic position". Most often it was regarded as a variety or subspecies of *O. rupestris* or *O. saxicola* [*O. rupestris* var. *dolomitica* Arnold [330], *O. saxicola* subsp. *dolomitica* (Arnold) Roux [331]].

Nowak [10] discussed the species under the name *O. saxicola* for *dolomitica* (Arnold) Arnold.

Distribution outside Europe. *Opegrapha dolomitica* has a Holarctic distribution, covering the whole Europe and North America (the Bahamas [142], Canada [332]). Recorded also from Africa (Morocco) [65].

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], this species distribution is boreal Mediterranean. In Europe, it grows on limestone or dolomitic rocks.

Reported, e.g., from Austria [71], the Czech Republic [295], Denmark [122,163], Great Britain [92], Italy [74], Norway [97], Romania [178,302], Russia (Dagestan [333]), Spain [99], Sweden [97], and Ukraine [334].

Habitat and distribution in Poland. In Poland, *Opegrapha dolomitica* occurs less frequently on limestone than on other rocks, such as sandstones. It occurs typically on vertical and smooth rock walls. The first record of *O. dolomitica* was published by Körber [21]. It was also reported by Stein [182], Eitner [303], Migula [130], and a few times in the Polish lichenological literature from Dolny Śląsk (Lower Silesia Province) [132], Łąćuch Tatrzański macroregion [106,107], Pieniny Mountains [110,111], Sudetes [260], and West Beskids [131].

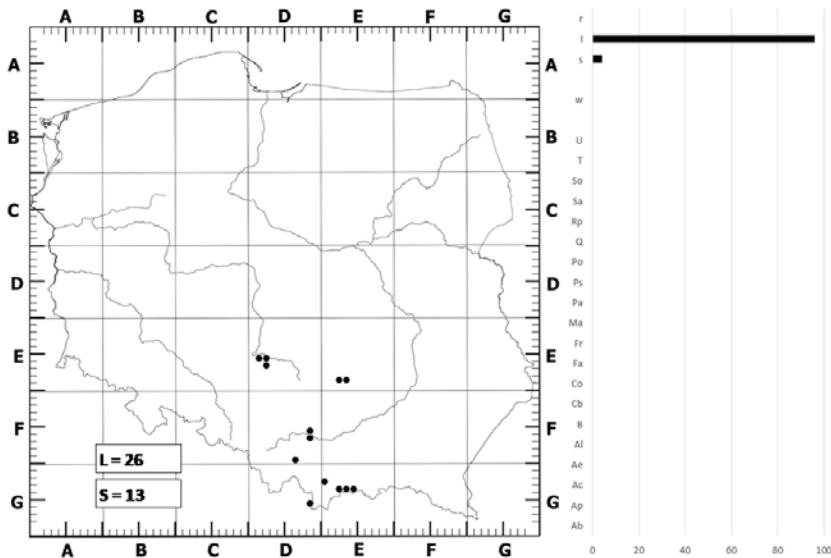

Fig. 48 Distribution and substrate preference of *Opegrapha dolomitica* in Poland.

Like most of the epilithic species of the studied genera, *O. dolomitica* is found in the southern part of the country, with a few scattered localities in the western part of the Polish Carpathians and uplands (Fig. 48).

4.6.9. **Opegrapha geographicola* (Arnold) Hafellner

Herzogia 10: 12 (1994).

≡ *Phaeospora geographicola* Arnold, Verh. Zool.-Bot. Ges. Wien 46: 140 (1896).

It is a lichenicolous nonlichenized fungus. It is parasitic on the host lichen thallus (*Rhizocarpon radioatum*). Ascomata black, roundish, not pruinose, usually elevated above the host thalli. Discs black, narrow, rarely broad. Exipulum permanent, thick, black, continuous below the hypothecium. Hypothecium 10–15 µm high. Hymenium 45–80 µm high, I+ reddish. Pseudoepitheciun inconspicuous. Ascii broadly club-shaped, mature 55–70 × 15–20 µm. Ascospores pale brown, ellipsoid, two–three-septate, 18–29 × 7–9 µm, darkening in herbarium specimens, with perispore of 0.8–1.4 µm thick. Wall of ascospores I+ blue. Pycnidia elevated or sessile, black. Conidia straight, 4–6 × 1 µm (Fig. 49).

Discussion. This species is morphologically similar to *Opegrapha dolomitica* and *Phacographa glaucomaria*, especially to the individuals that develop ascospores of the same size. It differs from the above taxa primarily due to its pale brown ascospores, as well as the color reaction of the transverse walls of the ascospores (I+ blue). Additionally, *O. geographicola* produces both three-septate and two-septate ascospores. It is difficult to understand the variability of this species, because only few herbarium specimens are available.

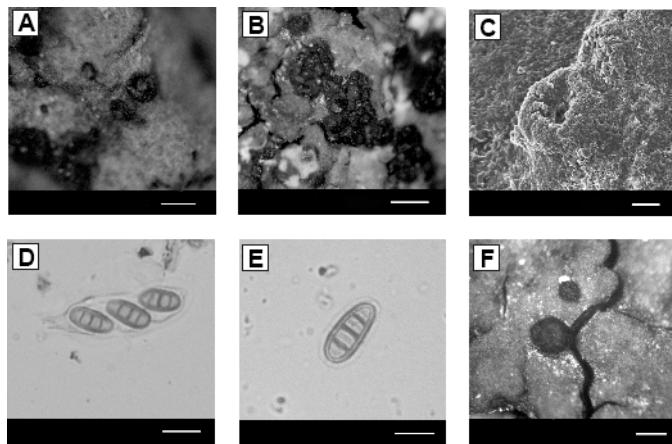

Fig. 49 *Opegrapha geographicola* (Arnold) Hafellner: (A,B) host thallus of *Rhizocarpon badioatrum* and apothecia, LM; (B) apothecium, LM; (D) ascus with ascospores, LM; (E) ascospore, LM; (F) pycnidia, LM (leg. A. Flakus, 2740/1, KRAM). Scale bars: (A,F) 1 mm; (B) 2 mm; (C,D) 30 µm; (E) 20 µm.

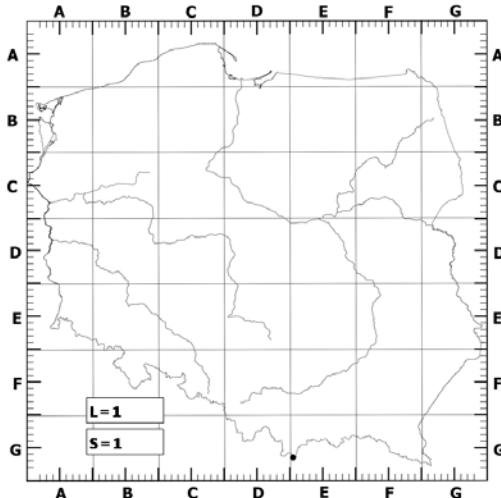

Fig. 50 Distribution of *Opegrapha geographicola* in Poland.

General distribution. Recorded from Alaska [67]. Known also from a few localities in Europe, e.g., from Austria [335] and Spain [99].

Habitat and distribution in Poland. This is a lichenicolous fungus that grows on *Rhizocarpon badioatrum* and is known only from one locality in the Western Tatras [336] (Fig. 50).

4.6.10. *Opegrapha lithyrga* Ach.

Lichenogr. Univers.: 247 (1810).

Thallus poorly developed, thin, smooth or granular, greyish. Ascomata solitary or in small groups, unbranched, rarely branched, straight or curved, $0.2\text{--}1 \times 0.15\text{--}0.25$ mm. Discs narrow, concave, not pruinose. Excipulum thick, permanent, black, naked, continuous below the hypothecium, $13\text{--}18 \mu\text{m}$ thick laterally and $40\text{--}60 \mu\text{m}$ at the base. Hypothecium grey-brown, $15\text{--}25 \mu\text{m}$ high. Hymenium hyaline, $60\text{--}70 \mu\text{m}$ high, I+ reddish. Pseudoepithecum insignificant, very narrow. Ascii cylindrical-clavate, mature $40\text{--}60 \times 15\text{--}18 \mu\text{m}$, inner layer of the endoascus amyloid along its whole length, ring hardly visible (*vulgata*-type). Ascospores hyaline, spindle-shaped, straight or slightly curved, five-seven-septate, $21\text{--}35 \times 3\text{--}5 \mu\text{m}$, with perispore of $1\text{--}1.5 \mu\text{m}$ thick. Pycnidia numerous, black, very small, sunken in thallus. Conidia straight, $3\text{--}5 \times 1\text{--}1.5 \mu\text{m}$ (Fig. 51). Chemistry: thalli K-, C-, PD-.

Discussion. The species is morphologically similar to *Arthonia calcarea* and *Alyxoria mougeotii*, especially the individuals that develop solitary, unbranched ascomata. The differences between the species primarily concern the structure of the apical apparatus and the color reaction of the inner layer of the endoascus: *calcarea*-type in *A. calcarea*, *varia*-type in *A. mougeotii*, and *vulgata*-type in *O. lithyrga*. Moreover, *O. lithyrga* differs from *A. calcarea* by five-seven-septate ascospores, and from *A. mougeotii* by narrower ascospores, with all cells of similar size.

Opegrapha lithyrga is closely related to *O. vulgata* [7]. However, the former is epilithic, while the latter is epiphytic. Moreover, *O. lithyrga* has much larger, mature asci, slightly wider ascospores, and shorter conidia. Undoubtedly, the species evolved by adapting to its substrate, which was confirmed by recent molecular analyses [7] that support their species status in spite of the close relationship.

Opegrapha lithyrga varies remarkably in size and shape of their ascomata. Nowak [10] distinguished three varieties with two forms (var. *lithyrga*, for. *lithyrga*, [for.] b. *steriza* Ach., [var]. β. *ochracea* Körb., var. *vestita* Redgr.) to reflect this variation.

This species has elliptic and elongate ascomata, with narrow concave or flat discs, and one excipulum type. Some specimens only have short and straight conidia (e.g., a specimen from WA herbarium), while others have long and curved conidia (Fig. 52). *Opegrapha lithyrga* is a well described species that is easy to distinguish from other epilithic species. Its spore size is uniform, $23\text{--}24 \times 3\text{--}3.5 \mu\text{m}$, and its perispore is well developed. All of the analyzed specimens had single and unbranched ascomata, with narrow and concave discs. They mostly represent the typical var. *lithyrga* described by Acharius [2].

Nomenclatural notes. The species was described by Acharius [2], who gave it the binomial name that is still in usage. Its similarity to *O. vulgata* was noted by Stizenberger [4], who classified it as *O. vulgata* var. *lithyrga*. *Opegrapha lithyrga* was listed in many works published in the nineteenth century as *O. lithyrga* [2,3,25], as *O. vulgata* for. *lithyrga*, [285], as *O. lithyrgiza* [5], or as synonymous with *O. vulgata* [4]. In the early twentieth century, it was treated as the distinct species *O. lithyrga* (e.g., [60]). Redinger [1] distinguished two varieties: var. *grisea* Körb. and var. *ochracea* Redgr., whereas Nowak [10] discussed three varieties: var. *lithyrga*, var. *ochracea*, and var. *vestita* (see above). Both authors distinguished them on the basis of morphological variation of the thalli. The lack of synonyms indicates that this taxon is interpreted rather unambiguously.

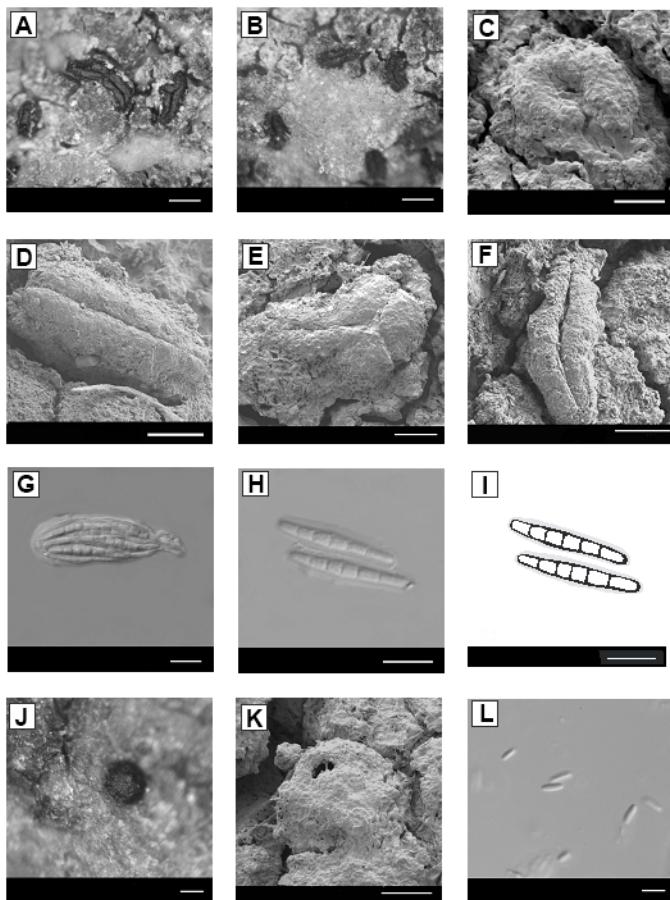

Fig. 51 *Opegrapha lithyrga* Ach.: (A,B) thallus and ascocarps, LM [(A) leg. J. Nowak, KRAM-L 13909; (B) leg. J. Nowak, KRAM-L 5059]; (C-F) thallus and ascocarps, SEM [(C,E) leg. J. Nowak, KRAM-L 5059; (D,F) leg. J. Nowak, KRAM-L 13909]; (G) ascus with ascospores, LM (leg. J. Nowak, KRAM-L 5557); (H,I) ascospores, LM (leg. J. Nowak, KRAM-L 5557); (J) pycnidium, LM (leg. J. Nowak, KRAM-L 13909); (K) pycnidium, SEM (leg. J. Nowak, KRAM-L 13909); (L) conidia, LM (leg. J. Nowak, KRAM-L 5557). Scale bars: (A,B,D,F,J) 100 µm; (C,E,K) 50 µm; (G,I) 10 µm; (L) 5 µm.

Distribution outside Europe. They are distributed in North America in mountainous regions, such as the high altitudes in Canada.

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], it is a Central European and Mediterranean species. In Europe, it is found on acidic shale/slate, granite, gneiss, and quartzite. It prefers smooth and vertical or hanging surfaces, in shaded habitats, usually with northern exposure that are dry or at least periodically slightly moist [10]. It probably spread from the south of Sweden and Norway to the Alps and southwestern

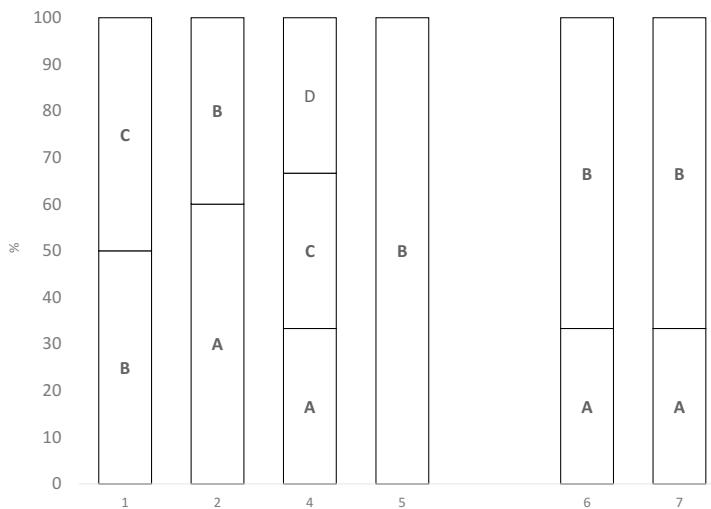

Fig. 52 *Opegrapha lithyrga*, variability of selected morphological-anatomical features. 1 – ascocarp shape: A – circular, B – elliptic, C – elongate; 2 – ascocarps: A – unbranched, B – branched; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Europe [34]. In Central Europe, it grows together with *Enterographa zonata* (Körb.) Källsten, *E. hutchinsiae* (Leight.) A. Massal. [38], whereas on the Atlantic coast of the Iberian Peninsula, it grows with *O. gyrocarpa* and *O. saxigena* Taylor [34].

In Europe, known, e.g., from Austria [71,160], Denmark [122,163], France [167], Germany [124–126,170,320,337], Great Britain [92], Ireland [94], Italy [74], Malta [95], Portugal (Madeira, Azores [75,98]), Spain [99], Turkey [153,154], and Ukraine [100].

Habitat and distribution in Poland. It grows on sandstone, but less commonly on other rock types. It is a very rare species. The first record of *O. lithyrga* was published by Nowak [187]. It has been reported from the Beskid Makowski Mountains [186], Beskid Mały Mountains [187], Beskid Sądecki Mountains [102], Beskid Śląski Mountains [189], Łącuch Tatrzański macroregion [210], Podhale [224], and Wyżyna Wieluńska (Wieluń Upland) [280].

Only three voucher specimens support records of this species in the western part of the Polish Carpathians (Fig. 53).

4.6.11. *Opegrapha niveoatra* (Borrer) J. R. Laundon

Lichenologist 2(2): 138 (1963).

≡ *Verrucaria niveoatra* Borrer, in Hooker, Engl. Bot., Supplement. 1: Tab. 2637 (1831).

= *Opegrapha vulgata* var. *subsiderella* Nyl., Lich. Scand. (Helsinki): 255 (1861).

= *Opegrapha subsiderella* (Nyl.) Arnold, Flora (Regensburg) 67: 656 (1884).

Thallus thin, continuous, sometimes in the form of spots, whitish or greyish, sometimes with green tint, with dark prothallus. Ascomata numerous, solitary or in groups, unbranched or

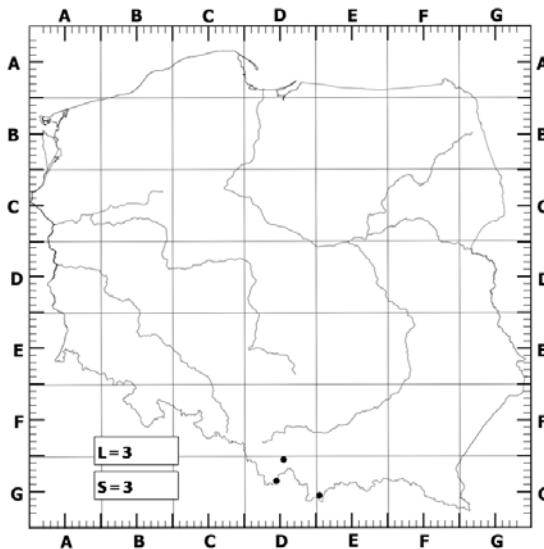

Fig. 53 Distribution of *Opegrapha lithyrga* in Poland.

more often branched, $0.3\text{--}1.5 \times 3\text{--}5$ mm. Discs narrow or delicately widened, concave, black, not pruinose. Excipulum of various thickness, elevated, permanent, black, naked, continuous below the hypothecium, $25\text{--}30 \mu\text{m}$ thick laterally and $40\text{--}50 \mu\text{m}$ at the base. Hymenium $50\text{--}60 \mu\text{m}$ high, I+ reddish. Hypothecium $10\text{--}20 \mu\text{m}$ high. Pseudoepitheciun very poorly developed, ca. $5\text{--}10 \mu\text{m}$ high. Ascii cylindrical-clavate, mature $45\text{--}55 \times 10\text{--}13 \mu\text{m}$, inner layer of endoascus amyloid along its whole length, small ring around ocular chamber (*vulgata*-type). Ascospores hyaline, spindle-shaped, straight or slightly curved, four-five(six)-septate, $20\text{--}25 \times 2.5\text{--}3.5 \mu\text{m}$, with inconspicuous perispore of $0.5\text{--}0.7 \mu\text{m}$ thick. Pycnidia numerous, small, black. Conidia highly variable, straight or slightly or very strongly curved, $4\text{--}9 \times 0.9\text{--}1.5 \mu\text{m}$ (Fig. 54). Chemistry: thalli K-, C-, PD-.

Discussion. An exceptional feature that differentiates *O. niveoatra* from the other *Opegrapha* species is the length of its conidia. In its typical form, *O. niveoatra* produces conidia that are $4\text{--}8(9) \mu\text{m}$ long. However, specimens without mature pycnidia are impossible to be distinguished from the closely related *O. vulgata*.

Morphological and anatomical variability of *O. niveoatra* (as in case of other species of the genus) is driven by the environmental factors. Nowak [10] distinguished three forms within the species [for. *niveoatra*, for. *intermedia* (B. de Lesd.) J. Nowak, and for. *olivaceonigra* (B. de Lesd.) J. Nowak] that differ in size and shape of their ascocarps. However, it should be noted that the species was misinterpreted by the author (see “Nomenclatural notes”).

My observations show that conidial size and shape differ markedly between and within populations of *O. niveoatra*. Specimens from Southern Europe are characterized by straight conidia up to $9 \mu\text{m}$ long [34]. By contrast, in material from Poland, both straight and slightly curved conidia are observed, sometimes on the same individual. Their length ranges from $4 \mu\text{m}$ to $8 \mu\text{m}$, regardless of the curve angle (Fig. 55).

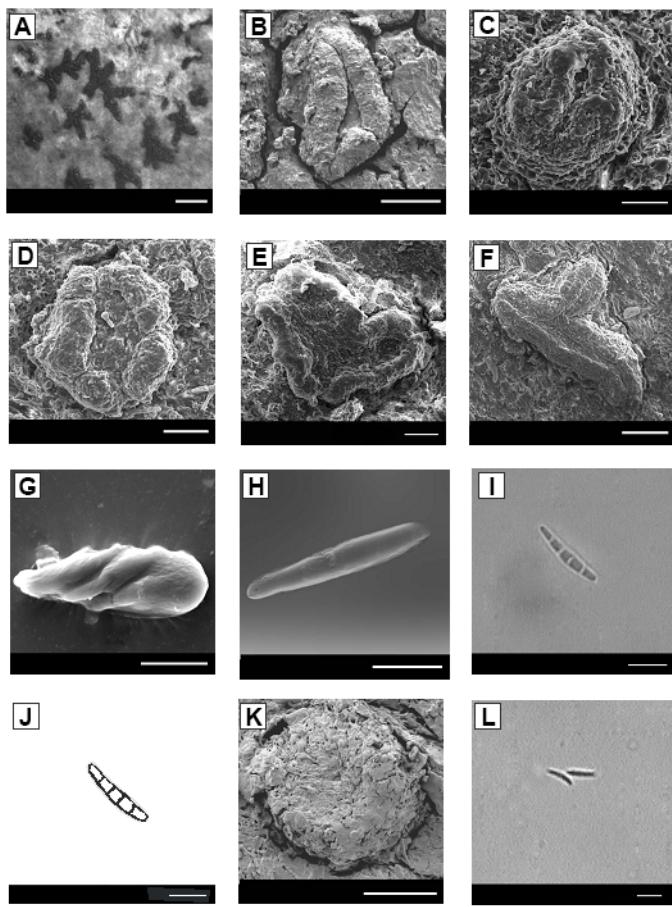

Fig. 54 *Opegrapha niveoatra* (Borrer) J. R. Laundon: (A) thallus and ascocarps, LM (leg. W. Fałtynowicz, UGDA-L 3435); (B–F) thallus and ascocarps, SEM [(B,C) leg. S. Cieśliński & Z. Tobolewski, 1984, KTC; (D) leg. W. Fałtynowicz, UGDA-L 3435; (E,F) leg. W. Fałtynowicz, UGDA-L 3435]; (G) ascus with ascospore, SEM (leg. W. Fałtynowicz, UGDA-L 3435); (H,I) ascospore, SEM (leg. S. Cieśliński & Z. Tobolewski, 1983, KTC); (J) ascospore, LM (leg. S. Cieśliński & Z. Tobolewski, 1983, KTC); (K) pycnidium, SEM (leg. W. Fałtynowicz, UGDA-L 3435); (L) conidia, LM (leg. W. Fałtynowicz, UGDA-L 3435). Scale bars: (A) 200 µm; (B–F) 100 µm; (G) 25 µm; (H–J) 10 µm; (K) 50 µm; (L) 5 µm.

Nomenclatural notes. Until the twentieth century, the taxon was named *Opegrapha vulgata* var. *subsiderella* [338], and then it was named *Opegrapha subsiderella* [339]. The names appeared, however, synonymously with *O. niveoatra* [340]. During the revision of voucher specimens, I found some Polish collections that were misidentified following Nowak [10]. In the treatment, Nowak described *O. niveoatra* that was characterized by a conidium length of 12–18 µm. This was misleading, as this size range of conidia is characteristic for *O. vulgata*.

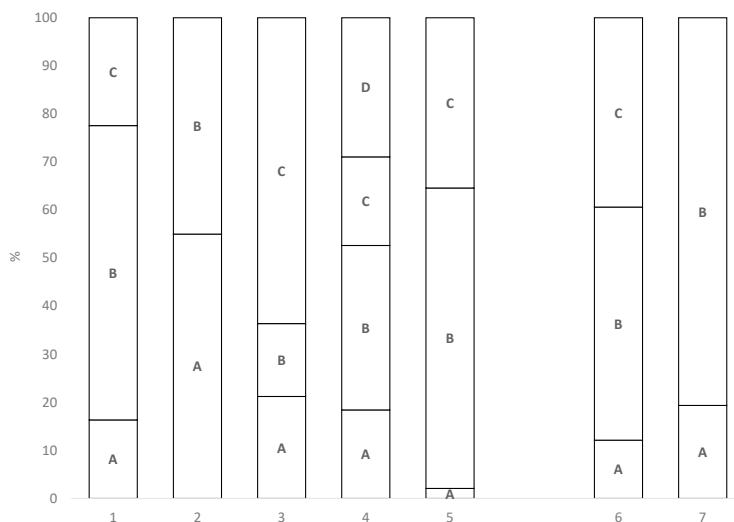

Fig. 55 *Opegrapha niveoatra*, variability of selected morphological-anatomical features. 1 – ascomata shape: A – circular, B – elliptic, C – elongate; 2 – ascocarp: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

This mistake was due to the fact that Nowak [10] accepted Redinger's concept of this species [1]. The latter author treated *O. niveoatra* under the name *O. cinerea* Chevall. This contradicts the currently valid classifications, where *O. cinerea* is a synonym of *O. vulgata*, which is characterized by curved conidia of such length [34,119,122]. However, according to Torrente and Egae [34], *O. niveoatra* is characterized by straight conidia that are 4–8 µm long. This is confirmed by the results of my study (Fig. 56). As a result of the revision of material in Polish herbaria, *O. niveoatra* was renamed and included under *O. vulgata*.

Distribution outside Europe. This species is distributed in North Africa (Morocco [65], Algeria [140]) and in a few localities in North America (Canada [66], USA [341]).

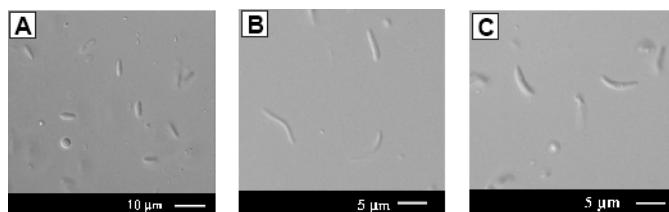

Fig. 56 Conidia of *Opegrapha niveoatra*, LM. (A) leg. Z. Tobolewski & S. Cieśliński, 1987, KTC; (B,C) leg. S. Cieśliński & Z. Tobolewski, 1983, KTC.

Habitat and distribution in Europe. *Opegrapha niveoatra* is a very rare sub-Atlantic species [38]. It grows in Central Europe on the bark of deciduous trees, especially in open sites. It is most frequently found on *Fagus sylvatica*, *Fraxinus excelsior*, and *Quercus* spp. Sometimes it grows together with *O. vulgata*, *O. ochrocheila*, and *Pertusaria leioplaca*.

According to Torrente and Egea [34], this species is known from Central and northwestern Europe. It is reported from, e.g., Austria [71], Denmark [122,163], Estonia [164], Finland [128], France [166,167], Germany [168,300], Great Britain [92], Ireland [73], Italy [74], Latvia [342], Lithuania [173], the Netherlands [96], Portugal (Madeira, Azores [75,98]), Romania [179], Russia [343–345], Spain [99], Sweden [97].

Habitat and distribution in Poland. In Poland, *O. niveoatra* grows in open and sparsely wooded habitats, on the smooth bark of these deciduous trees: *Fagus sylvatica*, *Quercus* spp., *Acer pseudoplatanus*, *Carpinus betulus*. Less often, it is found on other *Acer* spp., *Ulmus* spp., and *Fraxinus excelsior*. In mountains, it is found frequently on the bark of *Abies alba*.

Its first record was published by Grumann [346]. It also was reported by Eitner [303,347] and Migula [130]. The species also was reported from the Beskid Makowski Mountains [186], Beskid Niski Mountains [322], Beskid Sądecki Mountains [102,323,348], Beskid Śląski Mountains [189,190], Gorce Mountains [349], Karkonosze Mountains [350], Łąńcuch Tatrzański macroregion [107,210,211,351], Mierzeja Wiślana (Vistula Spit) [215], northeastern Poland [218], Pieniny Mountains [110], Pogórze Przemyskie (Przemyśl Foothills) [112], Pogórze Rożnowsko-Cieżkowickie (Rożnowsko-Cieżkowickie Foothills) [81], Pogórze Spiskie (Spisz Foothills) [225], Pojezierze Ełckie (Ełk Lakeland) [82,305], Pojezierze Kaszubskie (Kashubian Lake District) [83], Pojezierze Olsztyńskie (Olsztyn Lake District) [235,352,353], Równina Augustowska (Augustów Plain) [306], Równina Bielska (Bielsk Plain) [55,243], Równina Drawska (Drawno Plain) [244], Równina Kozienicka (Kozienice Plain) [245,246], Równina Piotrkowska (Piotrków Plain) [252], Roztocze [255,258], Sudetes [260], Uznam and Wolin islands [354], West Beskids [131,190,191], West Bieszczady Mountains [309,355], Western Pomerania [56], Wysoczyzna Białostocka (Białystok Highland) [271,356], Wysoczyzna Elbląska (Elbląg Highland) [273], and Wzgórza Radomszczańskie (Radomsko Hills) [216].

The species occurs in the mountains, where it is quite frequent in the western part of the Polish Carpathians and in the Bieszczady Mountains, and in northern Poland where it is scattered along the Pobrzeże Koszalińskie (Koszalin Coastland), Pojezierze Wschodniopomorskie (East Pomeranian Lake District), Pojezierze Mazurskie (Masurian Lake District), and Nizina Północnopodlaska (North Podlachian Lowland). In addition, it is reported from the Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland), Świętokrzyskie Mountains, and Równina Kozienicka (Fig. 57).

4.6.12. *Opegrapha saxicola* Ach.

Syn. Meth. Lich. (Lund): 71 (1814).

= *Opegrapha persoonii* Ach., Methodus, Sectio prior: 17 (1803).

= *Opegrapha rupestris* auct. polon. (non Pers.).

Thallus epilithic, thin, smooth or delicately wrinkled, dull, usually composed of small granules, sometimes powdery-granular, whitish, light grey. Ascomata not numerous, solitary or in groups, elevated, 0.4–1 × 0.1–0.2 mm, variable in shape. Discs narrow or wide, not pruinose,

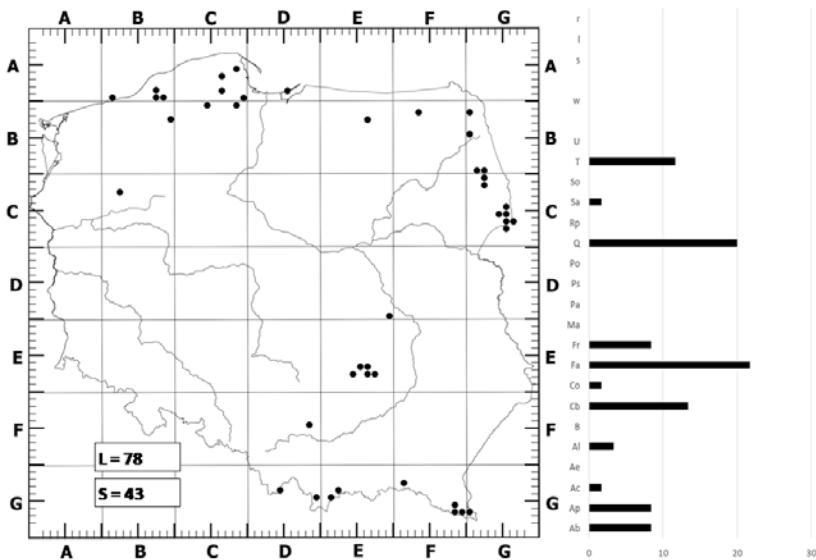

Fig. 57 Distribution and substrate preference of *Opegrapha niveoatra* in Poland.

dull. Excipulum relatively thick, elevated, permanent, black, naked, continuous below the hypothecium, 40–50 µm thick laterally and up to 90 µm at the base. Hypothecium from pale brownish-yellowish to nearly hyaline, 20–40 µm high. Hymenium hyaline, 60–80 µm high, I+ blue. Pseudoepithecium poorly developed, 10–15 µm high. Ascii club-shaped, 55–65 × 15–20 µm, inner layer of endoascus amyloid in upper half (*varia*-type). Ascospores hyaline, spindle-shaped, three-septate, 18–22(24) × 5–7 µm, with perispore of 1.0–1.2 µm thick. Pycnidia numerous, small, black. Conidia straight, 4–6 × 0.5–1 µm, cylindrical (Fig. 58). Chemistry: thalli K–, C–, PD–.

Discussion. *Opegrapha saxicola* differs from the otherwise similar *Arthonia calcarea* by the *varia*-type ascus, ascospores longer than 18 µm, and shorter conidia that are up to 6 µm long in *Opegrapha saxicola* and up to 8 µm long in *Arthonia calcarea*.

The species is not highly variable, as pointed out by Nowak [10]. This taxon is easy to recognize due to its relatively thin thallus that usually is whitish and gray, and its narrow, slender, elliptic, elongate, unbranched, or branched ascomata. It produces the ascomata with relatively narrow discs (Fig. 59).

Nomenclatural notes. Throughout the nineteenth century, *Opegrapha saxicola* was treated under various names, and the group of species has a complicated taxonomy. In 1989, Egea and Torrente [34] treated *O. saxicola* with *O. saxatilis*, and *O. persoonii* was a synonym of *O. rupestris*. A different concept was adopted by Purvis et al. [40], who accepted three species in this group based on ascospore length: *O. saxicola*, *O. saxatilis*, and *O. parasitica* (= *O. persoonii*). The authors' concept later was modified to distinguish: *O. dolomitica* (= *O. saxicola* auct., non Ach.) and *O. rupestris* (= *O. persoonii*), with the latter species as a strictly lichenicolous, parasitic species growing on crustose Verrucariaceae, especially *V. baldensis*

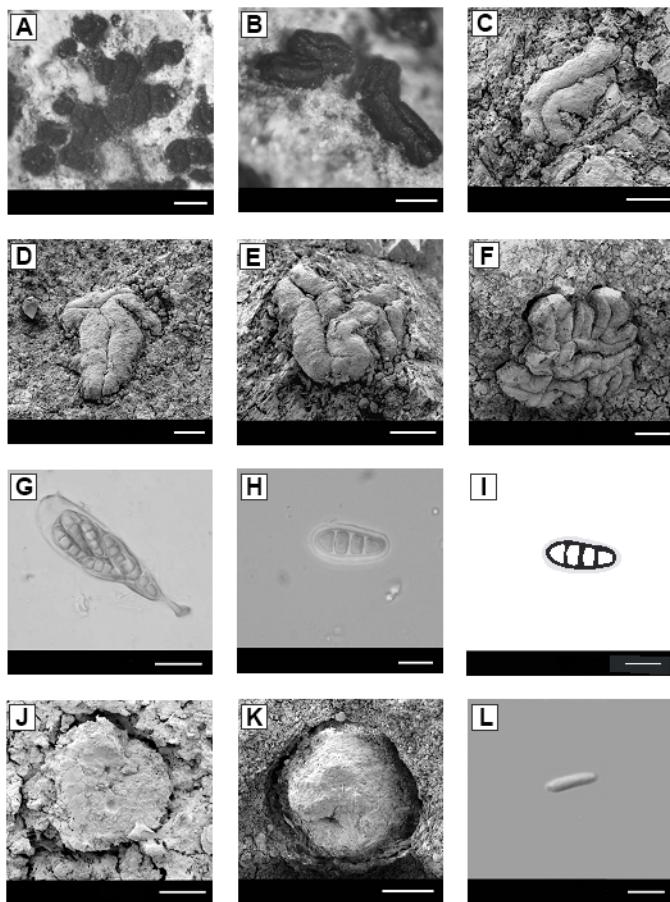

Fig. 58 *Opegrapha saxicola* Ach.: (A–F) thallus and ascomata, LM [(A,B) leg. J. Nowak, KRAM-L 12277]; (C–F) thallus and ascomata, SEM [(C,D) leg. J. Nowak, KRAM-L 12277; (E,F) leg. K. Taborowicz, 1975, KTC]; (G) ascus with ascospores, LM (leg. J. Nowak, KRAM-L 12277); (H,I) ascospores, LM (leg. U. Bielczyk, KRAM-L 44572); (J,K) pycnidium, SEM (leg. J. Nowak, KRAM-L 12277); (L) conidium, LM (leg. J. Nowak, KRAM-L 12277). Scale bars: (A,B,E,K) 100 µm; (C,D,F) 200 µm; (G) 20 µm; (H,I) 10 µm; (J) 50 µm; (L) 5 µm.

[41]. In the Polish material, the two species *O. dolomitica* and *O. saxicola* were distinguished based on length of the ascospores. However, *O. rupestris*, as described by Smith et al. [41], was not found in the material.

Distribution outside Europe. Known from a few localities in North Africa, e.g., in Morocco [357].

Habitat and distribution in Europe. According to Purvis et al. [40], *Opegrapha saxicola* is a Central European and Mediterranean species. It is found on limestone or calcareous schist,

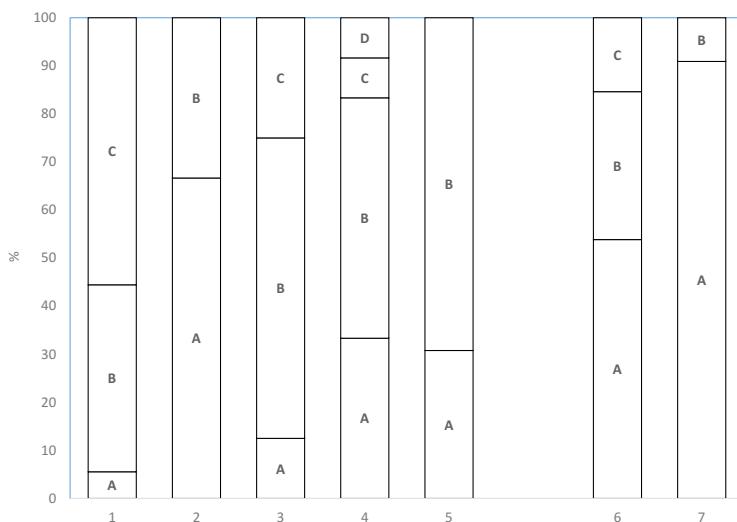

Fig. 59 Variation in selected morphological and anatomical features *Opegrapha saxicola*. 1 – ascocarpa shape: A – circular, B – elliptic, C – elongate; 2 – ascocarpa: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

and rarely on sandstone or shale/slate. It is known from Central, Southern, and Eastern Europe, and has been recorded from Austria [358] and Bosnia and Herzegovina [359].

Habitat and distribution in Poland. *Opegrapha saxicola* is found in southern Poland, on limestone or occasionally on other rocks. Its first record was published by Błoński (as *O. rupestris* [360]). It was reported from the Beskid Mały Mountains [187], Stołowe Mountains [198], Świętokrzyskie Mountains [105, 201, 361], Kotlina Orawsko-Nowotarska (Orava-Nowy Targ Basin) [362], Łąćuch Tatralski macroregion [363–365], Pieniny Mountains [110, 366], Pradolina Wrocławskiego (Wrocław Urstromtal) [238], Eastern Sudetes [367], Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland) [278], Wysoczyzna Bełchatowska (Bełchatów Highland) [268] and Wyżyna Wieluńska (Wieluń Upland) [280].

The species occurs in the western part of the Polish Carpathians and in the Wyżyna Krakowska upland. It also is recorded from the Sudety Mountains (Fig. 60).

4.6.13. *Opegrapha vermicellifera* (Kunze) J. R. Laundon

Lichenologist 2(2): 139 (1963).

≡ *Pyrenotheca vermicellifera* Kunze, in Reichenbach. & Schubert, Lich. Exsicc. No. 60 (1823).

Thallus thin, well developed, white-grey to dark grey, usually sterile. Ascocarps very rare, unbranched or branched, usually sessile, 115–118 × 76–375 µm. Discs of ascocarps narrow or wider, often concave, not pruinose, 11–264 µm wide. Excipulum black, slightly elevated,

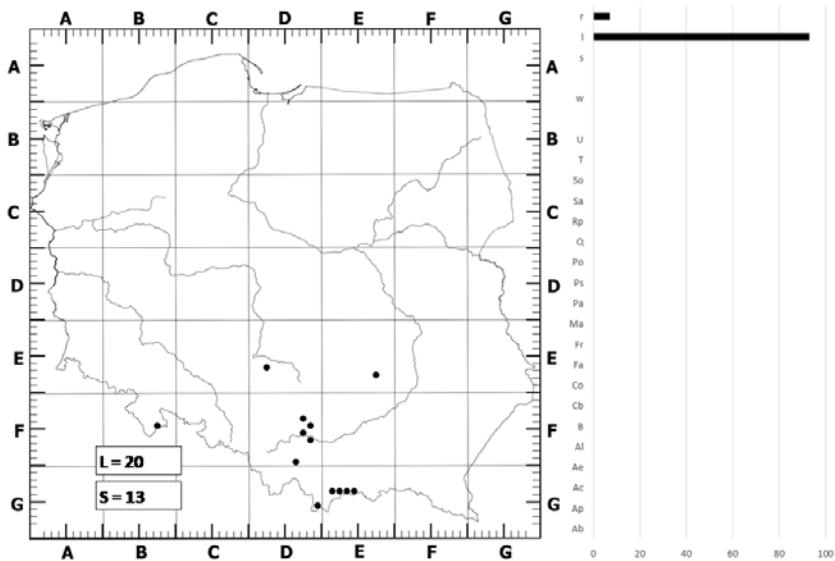

Fig. 60 Distribution and substrate preference of *Opegrapha saxicola* in Poland.

continuous below the hypothecium, 29–40 µm thick laterally and 40–50 µm at the base. Hypothecium brownish, 10–15 µm high. Hymenium hyaline, ca. 60 µm high. Pseudoepithecum very poorly developed. Ascii club-shaped, 40–50 × 12–15 µm, inner layer of endoascus amyloid nearly along its whole length (*vulgata*-type). Ascospores hyaline, straight, spindle-shaped, five–six-septate, 16–24 × 3–5 µm, with perispore of 0.8–1.0 µm thick. Pycnidia numerous, very characteristic whitish pruinose. Conidia straight, widened in the middle part, 3–4 × 1 µm (Fig. 61). Chemistry: thalli K–, C–, PD–.

Discussion. *Opegrapha vermicellifera* is a very characteristic, epiphytic species that has a large, whitish pruinose and nearly spherical pycnidia. The pycnidia help to distinguish it from the closely related species (*O. vulgata*, *O. niveoatra*, and *O. lithyrga*). This diagnostic feature is particularly useful for species identification in its sterile form and in material mixed with other taxa. Additionally, *O. vermicellifera* differs from the above mentioned *Opegrapha* spp. due to the presence of conidia that are widened in the middle part and only sometimes elongate.

The species varies remarkably in size and shape of ascomata. Nowak [10] accepted five forms of this species: for. *vermicellifera*, for. *discrepans* (Erichs) J. Nowak, for. *deplanata* (Erichs) J. Nowak, for. *subpulicaris* (Erichs) J. Nowak, and for. *spermogonifera* (Arnold?). The species is found usually in sterile form (for. *spermogonifera*) with numerous, convex, whitish pruinose pycnidia (Fig. 62). Specimens producing the ascomata are infrequent, and ascomata are elliptic, elongate, unbranched, and branched with a convex or rarely concave or flat disc.

Nomenclatural notes. This species was described in 1823 as *Pyrenopeziza vermicellifera* [368], and Laundon referred to it as *Opegrapha vermicellifera* in 1963 [369].

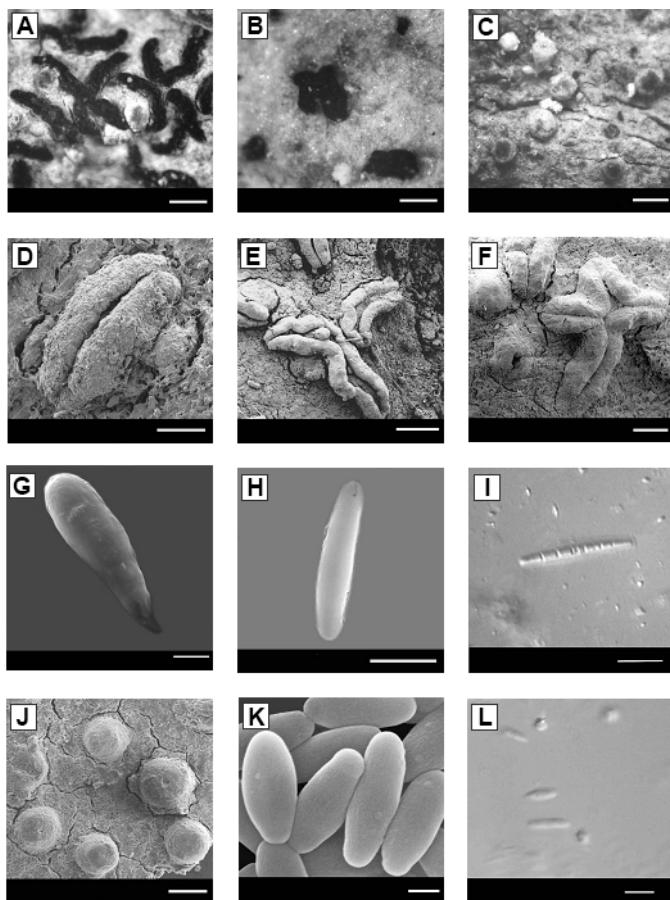

Fig. 61 *Opegrapha vermicellifera* (Kunze) J. R. Laundon: (A–C) thallus and ascocarps, LM [(A) leg. A. Wieczorek, 2001, herb. Wieczorek; (B) leg. J. Nowak, KRAM-L 19963; (C) leg. A. Wieczorek, 1995, herb. Wieczorek]; (D–F) thallus and ascocarps, SEM [(D,F) leg. A. Wieczorek, 2001, herb. Wieczorek; (E) leg. A. Wieczorek, 1997, herb. Wieczorek]; (G) ascus, SEM (leg. A. Wieczorek, 1997, herb. Wieczorek); (H) ascospore, SEM (leg. A. Wieczorek, 1997, herb. Wieczorek); (I) six-septate ascospore, LM (leg. A. Wieczorek, 2001, herb. Wieczorek); (J) pycnidia, SEM (leg. P. Czarnota, GPN 2946); (K) conidia, SEM (leg. P. Czarnota, GPN 2946); (L) conidia, LM (leg. P. Czarnota, GPN 2946). Scale bars: (A) 300 µm; (B) 400 µm; (C,J) 200 µm; (D,F) 100 µm; (E) 250 µm; (G–J) 10 µm; (K) 1 µm; (L) 5 µm.

Distribution outside Europe. The species is recorded primarily from Europe but also from Africa (Morocco) [65].

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], this species is found in Central European, Mediterranean, and sub-Atlantic regions. It is found on the bark of deciduous trees, including *Carpinus betulus*, *Quercus* sp., and *Fraxinus excelsior*. It is less often found on conifers. As late as the 1980s, it has not been reported from Southern Europe [10].

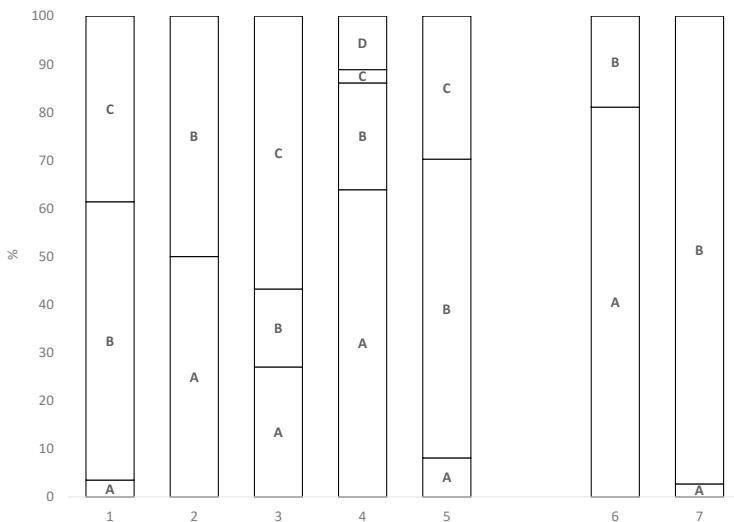

Fig. 62 Variation in selected morphological and anatomical features *Opegrapha vermicellifera*. 1 – ascocarp shape: A – circular, B – elliptic, C – elongate; 2 – ascocarp: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Currently it is known from, e.g., Austria [71], the Czech Republic [295], Denmark [122,163], France [166], Germany [90,91,124–126,168,337], Great Britain [92], Ireland [94], Italy [74], Latvia [172], Lithuania [173], the Netherlands [96], Norway and Sweden [128], Portugal (Azores [98]), Slovenia [76], Spain [99], Switzerland [129], and Ukraine [100].

Habitat and distribution in Poland. *Opegrapha vermicellifera* clearly prefers extensive woodlands. It is found on the bark of deciduous trees, most often on *Fagus sylvatica* and *Ulmus* spp. However, it is less often found on *Quercus* spp., *Fraxinus excelsior*, *Acer* spp., *Carpinus betulus*, and occasionally it can be found on *Aesculus hippocastanum*, *Populus* spp., *Pyrus* sp., and *Robinia pseudacacia* [369]. Its preferred habitats are moderately acidic (pH 4.9–5.6) to neutral (pH 5.7–7.0) [38]. It is a typical skiophyte, hence it needs shaded conditions for proper development, which is similar to *O. atra* or *Zwackhia viridis* [38].

The first record of *O. vermicellifera* was published by Eitner [370] and Migula [130]. The species was reported from: Dolny Ślask (Lower Silesia Province) [132], Świętokrzyskie Mountains [199–201], Karkonosze Mountains [202], Mierzeja Wiślana (Vistula Spit) [215], Niecka Włoszczowska (Włoszczowa Basin) [216], northeastern Poland [218], Pobrzeże Szczecinińskie (Szczecin Coastland) [80], Pojezierze Elckie (Elk Lakeland) [305], Pojezierze Olsztyńskie (Olsztyn Lake District) [235,236], Pogórze Przemyskie (Przemyśl Foothills) [112], Równina Bielska (Bielsk Plain) [55,243], Równina Drawska (Drawno Plain) [244], Równina Kozinicka (Kozińce Plain) [245,246,371,372], Śląsk Opolski (Opole Silesia) [262], Uznam and Wolin islands [354], West Bieszczady Mountains [373–376], West Carpathians [12], Western Pomerania [56,377], Wybrzeże Słowińskie (Slovinskian Coast) [378], Wysoczyzna

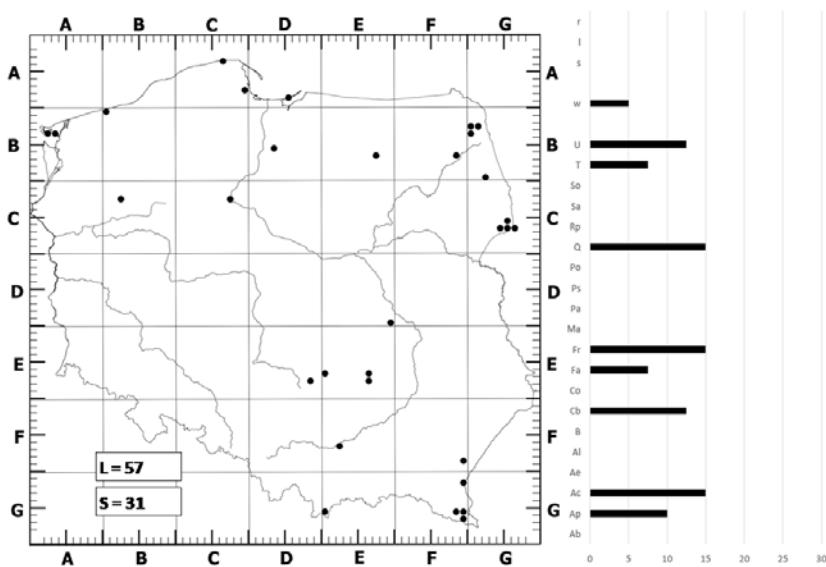

Fig. 63 Distribution and substrate preference of *Opegrapha vermicellifera* in Poland.

Białostocka (Białystok Highland) [356], and Wzgórza Radomszczańskie (Radomsko Hills) [216]. According to Nowak [10], this species was often misidentified and overlooked during field research because of its usually sterile thalli.

The species is scattered in the lowlands, and it is rare in the uplands and mountains (Fig. 63). In the mountains, it has been recorded only from the West Bieszczady Mountains and from a few localities in the Western Tatras.

4.6.14. *Opegrapha vulgata* (Ach.) Ach.

Meth. Lich.: 20 (1803).

≡ *Lichen vulgatus* Ach., Lichenogr. Suec. Prodr. 21 (1799) [1798].

= *Opegrapha cinerea* Chevall., J. Phys. Chim. Hist. Nat. Arts 94: 41 (1822).

= *Opegrapha devulgata* Nyl., Flora (Regensburg) 62: 358 (1879).

= *Opegrapha niveoatra* auct. polon. (according to Nowak 1983) [non (Borrer) J. R. Laundon].

Thallus thin, continuous or cracked, smooth or granular, white-grey to green-brown. Ascomata numerous, solitary or in small groups, straight or curved, rarely branched, 0.5–1.5 × 0.15–0.25 mm. Discs narrow, very rarely widened, sunken, black, not pruinose. Excipulum permanent, elevated, black, naked, continuous below the hypothecium, 20–45 µm thick laterally and 30–70 µm at the base. Hypothecium dirty yellowish, 15–35 µm high. Hymenium hyaline, 40–60 µm high, I+ reddish. Pseudoepitheciwm poorly developed. Ascii cylindrical-clavate, mature 40–50 × 11–18 µm, young 30–40 × 10–13 µm, inner layer of endoascus amyloid along its whole length, ring around small ocular chamber (*vulgata*-type). Ascospores hyaline, spindle-shaped, usually straight or slightly curved, five-six-septate, 19–28 × 3–5 µm, with thin perispore of 1 µm, sometimes inconspicuous. Pycnidia numerous, sunken, small, black.

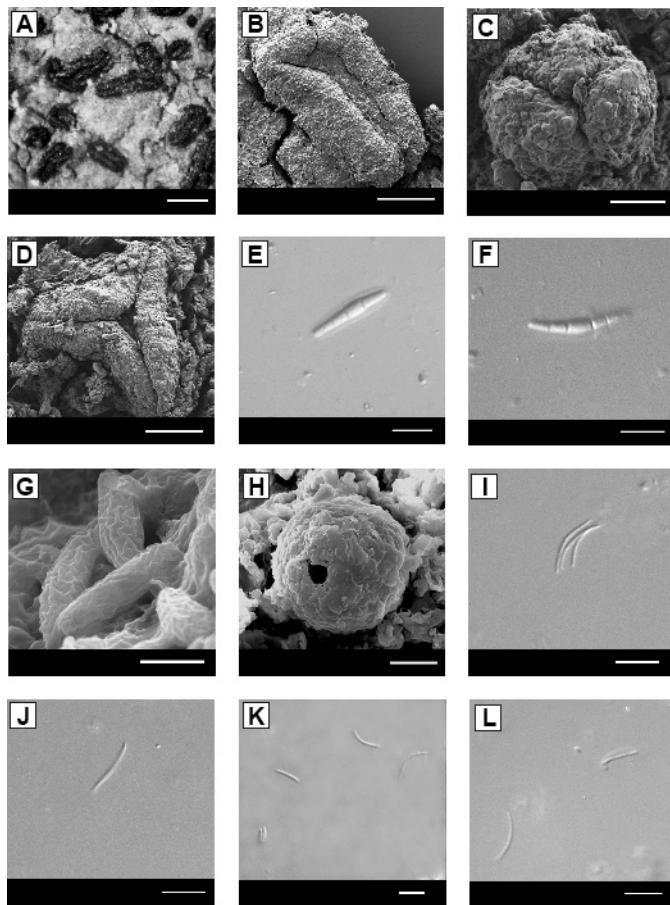

Fig. 64 *Opegrapha vulgata* (Ach.) Ach.: (A) thallus and ascocarps, LM (leg. J. Nowak, KRAM-L 16211); (B–D) thallus and ascocarps, SEM (leg. J. Nowak, KRAM-L 16211); (E) three-septate ascospore, LM (leg. J. Nowak, KRAM-L 7288); (F) six-septate ascospore, LM (leg. J. Nowak, KRAM-L 10012); (G) ascospores, SEM (leg. J. Nowak, KRAM-L 7252); (H) pycnidium, SEM (leg. J. Nowak, KRAM-L 16211); (I–L) conidia, LM (leg. J. Nowak, KRAM-L 7252). Scale bars: (A) 200 µm; (B,D) 100 µm; (C) 50 µm; (E–G,I–L) 10 µm; (H) 30 µm.

Conidia highly variable, straight, or slightly or strongly curved, 9–15 × 0.9–1.5 µm (Fig. 64). Chemistry: thalli K–, C–, PD–.

Discussion. *Opegrapha vulgata* is closely related to *O. vermicellifera* and *O. niveoatra* [7]. Its long conidia and small, hardly visible, but not pruinose pycnidia help to separate it from the two morphologically similar species.

In *Opegrapha vulgata*, inter- and intrapopulation variation is observed in size and shape of the ascocarps (Fig. 65). The variation is associated with diverse habitat conditions. The conidia size and shape also are highly variable. In general, the species has long and strongly

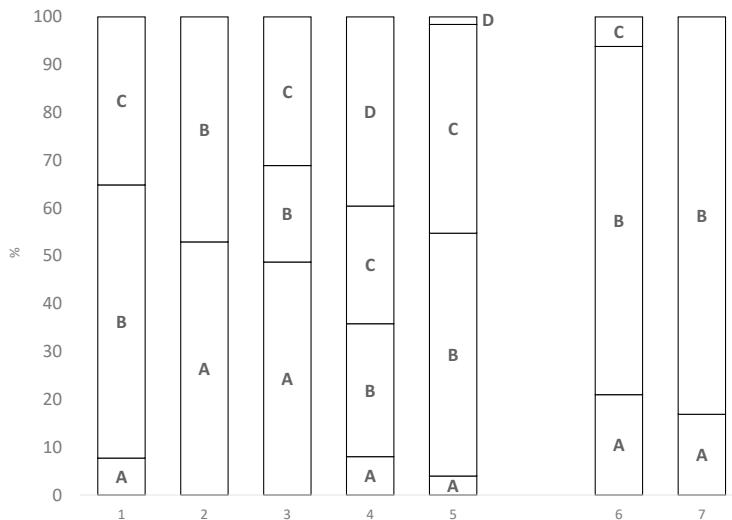

Fig. 65 Variation in selected morphological and anatomical features *Opegrapha vulgata*. 1 – ascocarps shape: A – circular, B – elliptic, C – elongate; 2 – ascocarps: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

curved conidia. However, sometimes highly variable conidia can be observed within the same population: from straight to slightly or strongly curved. This also was noted by Purvis et al. [40], who distinguished three types of conidia on the basis of their size and shape. In this study, shape and size of conidia were used as the most reliable diagnostic features for this species.

Nomenclatural notes. The species was described by Acharius [18] as *Lichen vulgatus*, and it was moved to *Opegrapha* later by the same author [17]. In the eighteenth and nineteenth century, the taxon was treated under various names (*O. cinerea*, *O. confluens*, *O. devulgata*) because of the high variation in size and shape of the ascocarps, ascospores, and conidia (e.g., [1]). To show this morphological variation, 22 heterotypic names of intraspecific taxa also were introduced [1]. Nowak [10] accepted two species: *O. devulgata* and *O. vulgata*.

Distribution outside Europe. This species has a wide geographic range. It can be found in the USA [135,136,138,139,379], the Republic of Khakassia in Asia [380], and Australia [381]. The taxon is frequent in oceanic climates in the Euro-Siberian and Mediterranean regions, e.g., in Israel [148], Iran [382], and Morocco [65]. It rarely occurs in dry habitats [34].

Habitat and distribution in Europe. Wirth [38] and Wirth et al. [39] defined it as having a Central European distribution where it can be found in lowland forests, in shaded habitats on slightly acidic bark. Reported, e.g., from Austria [71], the Czech Republic [295], Denmark

[122,163,383], Estonia [123], Finland [165], France [166], Germany [124,168,297], Great Britain [92], Greece [384], Hungary [93], Ireland [73], Italy [74,171], Latvia [172], Lithuania [173,174], Montenegro [176], the Netherlands [96], Norway [97], Portugal (Madeira, Azores [75,177]), Romania [179], Slovenia [76,385], Spain [99], Sweden [97], Switzerland [129], Turkey [153,154], and Ukraine [100].

Habitat and distribution in Poland. *Opegrapha vulgata* is found on the bark of both deciduous and coniferous trees in Poland. In the lowlands, it has been found on *Carpinus betulus*, *Fagus sylvatica*, *Quercus* spp., and *Acer* spp.; in the mountains, it is found on the bark of coniferous trees: *Abies alba*, *Picea abies*, and *Pinus* spp. It grows on slightly acidic substrates, with pH 4.1–4.8 [38]. The first records of *O. vulgata* were published by Körber [21], Ohlert [77], Stein [182], Eitner [303], and Lettau [78]. Later it was reported from the Beskid Makowski Mountains [186], Beskid Mały Mountains [187,321], Beskid Niski Mountains [188], Beskid Sądecki Mountains [102,103,323], Beskid Śląski Mountains [189], Bory Tucholskie (Tuchola Forest) [194], Dolny Śląsk (Lower Silesia Province) [132], Gorce Mountains [349], Świętokrzyskie Mountains [105,201,361], Kotlina Biebrzańska (Biebrza Basin) [205], Łąćuch Tatrzanski macroregion [107,365], northeastern Poland [218], Pieniny Mountains [111,366], Płaskowyż Nałęczowski (Nałęczów Plateau) [220], Pobrzeże Szczecińskie (Szczecin Coastland) [80], Pogórze Spiskie (Spisz Foothills) [225], Pojezierze Ełckie (Ełk Lakeland) [305], Pojezierze Kaszubskie (Kashubian Lake District) [232], Pojezierze Olsztyńskie (Olsztyn Lake District) [235,353], Pradolina Wrocławska (Wrocław Urstromtal) [238], Roztocze [258,386], Równina Augustowska (Augustów Plain) [239], Równina Drawska (Drawno Plain) [244], Równina Kozienna (Kozienna Plain) [246], Równina Piotrkowska (Piotrków Plain) [252,253], Równina Ślupska (Ślupsk Plain) [86], Sudetes [260,367], Śląsk Opolski (Opole Silesia) [262], Uznam and Wolin islands [354], West Beskids [131], West Bieszczady Mountains [309], Western Pomerania [56,84], Wybrzeże Słowińskie (Slovincian Coast) [378], Wysoczyzna Białostocka (Białystok Highland) [356], Wyżyna Wieluńska (Wieluń Upland) [280], Wyżyna Lubelska (Lublin Upland) [87], and Wzgórza Radomszczańskie (Radomsko Hills) [216].

The species is frequent in various areas of Poland (Fig. 66). In the south, it is known in the western part of the Polish Carpathians (mostly the Beskid Wysoki Mountains, Beskid Średni Mountains, Tatras, and also East Beskids) and Kotlina Kłodzka (Kłodzko Basin). Outside of the mountains, it is frequent in the lowlands [mostly in the Pojezierze Kaszubskie, Warmia and Masuria, and Nizina Podlaska (Podlachian Lowland)]. It also is scattered in the northern part of the Wyżyna Małopolska (Lesser Poland Upland).

4.6.15. **Phacographa glaucomaria* (Nyl.) Hafellner

Bibliotheca Lichenol. 100: 102 (2009).

≡ *Lecidea glaucomaria* Nyl., Bot. Notiser: 177 (1852).

≡ *Opegrapha glaucomaria* (Nyl.) Källsten ex Hafellner, Bull. Soc. Linn. Provence 45: 227 (1994).

It is a lichenicolous nonlichenized fungus. It is parasitic on the host lichen thallus (*Protoparmelia badia*). Ascomata black, roundish, naked, usually elevated above host thalli, very rarely. Discs black, narrow, rarely broad. Excipulum permanent, thick, black, continuous below the hypothecium. Hypothecium grey to grey-brown, dark, 10–14 µm high, upper part of hypothecium K+ yellowish. Hymenium 50–75 µm high, I+ reddish. Pseudoepithecioid very

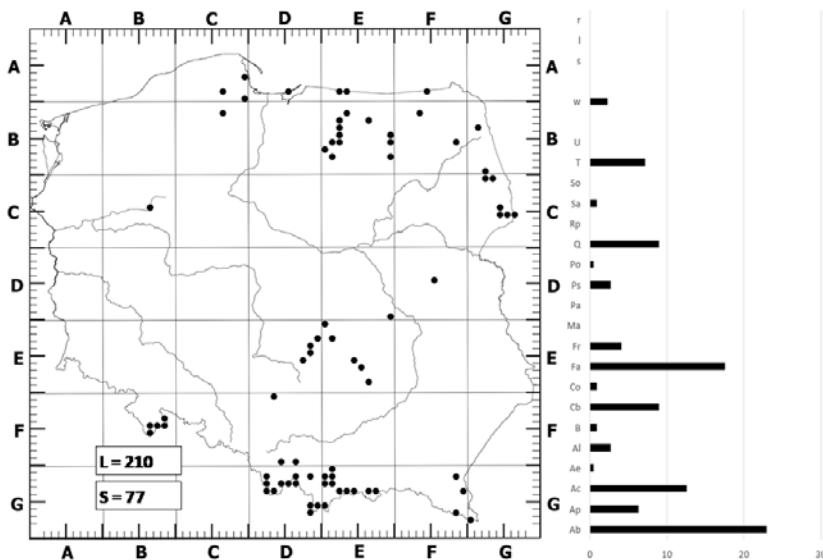

Fig. 66 Distribution and substrate preference of *Opegrapha vulgata* in Poland.

poorly developed, brown. Ascii broadly club-shaped, mature $60\text{--}75 \times 18\text{--}30 \mu\text{m}$. Ascospores hyaline, ellipsoid, two–three-septate, $18\text{--}29 \times 7\text{--}9 \mu\text{m}$, darkening in herbarium specimens, with perispore of $0.6\text{--}1.4 \mu\text{m}$ thick. Pycnidia elevated or sessile, black. Conidia straight, $4\text{--}6 \times 1 \mu\text{m}$ (Fig. 67).

Discussion. *Phacographa glaucomaria* is characterized by its epruinose ascocarps, with exposed discs. It differs from *Opegrapha dolomitica* in its color reaction in the upper part of the hypothecium (K+ yellowish) and its slightly wider ascospores. It differs from *Arthonia calcarea* due to its much longer and wider ascospores, and the presence of a well-developed perispore. It is difficult to assess its intraspecific variability due to too few herbarium specimens available. The two specimens studied were morphologically similar. Small differences were noted in ascospore size, but they are typical for this taxon. This species was not treated by Nowak [10].

Nomenclatural notes. The species was described by Nylander [387] as *Lecidea glaucomaria*. It was moved to *Opegrapha* in 1994, and recently to *Phacographa* [388].

General distribution. It has been reported from Canada [66], Austria [335], Portugal (Madeira [75]), and Spain [99].

Habitat and distribution in Poland. In Poland, this parasitic fungus grows on the thalli of *Protoparmelia badia*. It was recorded only from the High Tatras at the Mięguszowiecka Przełęcz Wyżnia (Mięguszowiecka Wyżnia Pass) and from Mięguszowiecki Szczyt Czarny (Mięguszowiecki Black Peak) [336] (Fig. 68).

Scale bars: (A) 500 µm; (B,C) 200 µm; (D,K) 100 µm; (E,H,I) 10 µm; (F,G,L) 5 µm.

convex, 0.4–1.2 × 0.1–0.3 mm. Discs narrow, rarely widened, sunken, black, not pruinose. Excipulum permanent, thick, elevated, black, naked, continuous below the hypothecium, 20–40 µm thick laterally and 30–60 µm at the base. Hypothecium 10–25 µm high, I+ blue. Hymenium ca. 35–70 µm high, I+ reddish. Ascii club-shaped, mature 40–60 × 10–12 µm, young 30–40 × 10–11 µm, inner layer of endoascus amyloid nearly along its whole length (*vulgata*-type). Ascospores hyaline, spindle-shaped, straight or slightly curved, three-septate, 15–25 × 3–4 µm, without perispore. Pycnidia numerous, small, black. Conidia straight or slightly curved, 4–7 × 0.8–2 µm (Fig. 69). Chemistry: thalli K–, C–, PD–.

Discussion. *Pseudoschismatomma rufescens* differs from the otherwise similar *Arthonia atra*, *Alyxoria culmigena*, and *A. ochrocheila* due to its narrower ascospores and the lack of a perispore. The primary diagnostic features of *Pseudoschismatomma rufescens* are: (i) the ascomata are relatively short and usually sunken or surrounded by the thallus, (ii) there is a lack of a perispore, and (iii) it has narrow ascospores.

Pseudoschismatomma rufescens is morphologically variable. Two varieties were described: var. *rufescens* (Pers.) Mudd and var. *subocellata* Ach., with a total of 10 forms [var. *rufescens* for. *rufescens*, for. *disparate* (Ach.) Grumm., for. *rubella* (Pers.) Grumm., for. *elegans* (Borr.) Grumm., for. *arthonioidea* (Schaer.), for. *herpetica* (Ach.), for. *fuscata* (Turn. Ach.), for. *stellaris* (Müll. Arg.), var. δ. *subocellata* (Ach.) Schaer., for. *subocellata*, for. *albicans* (Chev.) Grumm.], which seem to be of little taxonomic value [10]. There is intraspecific variation in thallus color, and size and shape of the ascomata (Fig. 70). The characters are of little diagnostic value, as they change considerably with environmental factors. The size and shape of the conidia are quite variable as well, with either straight or mixed conidia (straight and slightly curved) occurring occasionally in the same population or on the same thallus.

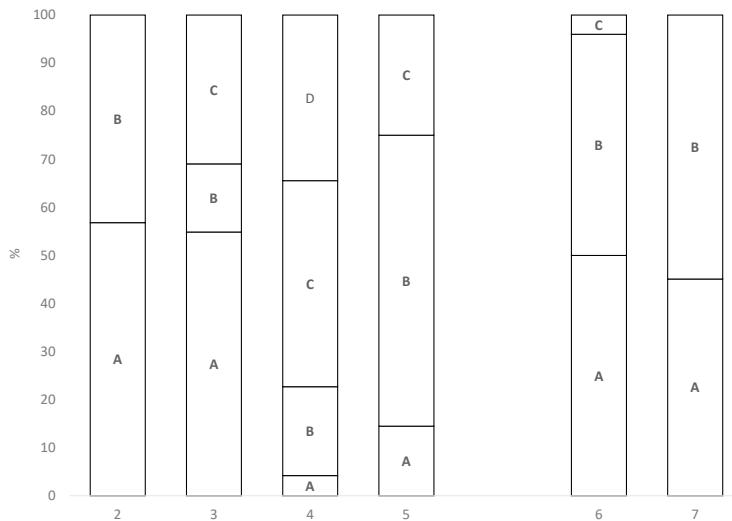

Fig. 70 Variation in selected morphological and anatomical features of *Pseudoschismatomma rufescens*. 1 – ascomata shape: A – circular, B – elliptic, C – elongate; 2 – ascomata: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Nomenclatural notes. The species was described by Persoon [283] as *Opegrapha rufescens*. Ertz et al. [6] placed it in *Pseudoschismatomma* and noted its close morphological and anatomical similarity to species of the family Roccellaceae, including the genera *Lecanactis* and *Schismatomma*. This similarity was mentioned by Diederich et al. [36], who pointed out the lack of a perispore in ascospores of the taxa.

Distribution outside Europe. This species has a wide geographic range, being distributed in China [144], Morocco [65], Mongolia [389], the USA [138,288,390], and Canada [66].

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], this species occurs in boreal Mediterranean and sub-Atlantic regions. *Pseudoschismatomma rufescens* grows on the bark of *Carpinus betulus*, *Fagus sylvatica*, *Fraxinus excelsior*, and *Quercus* spp., and occasionally on *Abies* spp. and *Picea* spp. It usually is found in natural broad-leaved forest stands, where it is sometimes seen on trees growing along rivers and streams. It prefers moderately acidic to neutral substrates, with pH 4.9–7.0 [38].

This species has been reported from Austria [71,160], the Czech Republic [295], Denmark [122,163], Estonia [123], Finland [165], France [166,167], Germany [124,170,297], Great Britain [92], Greece [127], Hungary [93], Ireland [94], Italy [74], Latvia [172], Lithuania [173,174], Malta [95], Montenegro [316], the Netherlands [96], Norway [97], Portugal (Madeira, Azory [75,98]), Romania [178], Russia (Dagestan [333]), Slovenia [76], Spain [99], Sweden [97], Switzerland [129], and Ukraine [100,180,181].

Habitat and distribution in Poland. *Pseudoschismatomma rufescens* occurs primarily in extensive natural woodlands and sometimes on isolated trees. It prefers shaded and slightly moist habitats. It is widespread (in some places common) in the lowlands and mountains to the lower montane zone of Poland. It grows on the bark of deciduous trees (*Carpinus betulus*, *Fagus sylvatica*, *Fraxinus excelsior*, *Quercus* spp., less often on *Salix* spp.), occasionally on *Abies alba*, exceptionally on *Picea abies*.

The first records of *Pseudoschismatomma rufescens* were published by Körber [21], Ohlert [77], Stein [182], Eitner [303,347], and Lettau [78]. It was reported from Galicia [391], the Beskid Makowski Mountains [186], Beskid Mały Mountains [321], Beskid Niski Mountains [188,322], Beskid Sądecki Mountains [103,323], Beskid Śląski Mountains [189,190], Beskidy Lesiste Mountains [191], Bieszczady Mountains [193,376], Bory Tucholskie (Tuchola Forest) [194], Dolina Dolnego Sanu (Lower San River Valley) [104,392], Dolina Konińska (Konin Valley) [196], Dolina Wisły (Vistula Valley) [393,394], Dolny Śląsk (Lower Silesia Province) [132], Gorce Mountains [349], Stołowe Mountains [198], Świętokrzyskie Mountains [199–201], Kotlina Gorzowska (Gorzów Basin) [395], Kotlina Orawsko-Nowotarska (Orava-Nowy Targ Basin) [362], Kotlina Sandomierska (Sandomierz Basin) [396,397], Kotlina Żywiecka (Żywiec Basin) [207], Łąćuch Tatrzanski macroregion [210,211], Masyw Ślęży (Ślęza Massif) [213], Nizina Mazowiecka (Mazovian Lowland) [217], Padół Zamojski (Zamość Depression) [223], Pieniny Mountains [110,111,398], Płaskowyż Nałęczowski (Nałęczów Plateau) [220], Pobrzeże Kaszubskie (Kashubian Coastland) [79,221], Pobrzeże Szczecińskie (Szczecin Coastland) [80,222], Podgórze Rzeszowskie (Rzeszów Foothills) [223], Pogórze Przemyskie (Przemyśl Foothills) [112], Pogórze Rożnowsko-Cieżkowickie (Rożnowsko-Cieżkowickie Foothills) [81], Pogórze Spiskie (Spisz Foothills) [225], Pojezierze Ełckie (Ełk Lakeland) [305,399], Pojezierze Gnieźnieńskie (Gniezno Lake District) [229], Pojezierze Kaszubskie (Kashubian Lake District) [232], Pojezierze Krajeńskie (Krajna Lake District) [233], Pojezierze Olsztyńskie (Olsztyn Lake District) [235], northeastern Poland [218], Pradolina Wieprza (Wieprz River Urstromtal) [237], Równina Drawska (Drawno Plain) [85,244], Roztocze [255,256,258], Równina Augustowska (Augustów Plain) [239,241,307], Równina Bielska (Bielsk Plain) [55,243], Równina Białgorajska (Bialgorajska Plain) [308], Równina Drawska, Równina Kozienicka (Kozienice Plain) [245,373,400], Równina Łęczyńsko-Włodawska

(Łęczna-Włodawa Plain) [247], Równina Łukowska (Łuków Plain) [251], Równina Słupska (Słupsk Plain) [86,401], Sudetes [260,261,367], Śląsk Opolski (Opole Silesia) [262], West Beskids [131,190,191], Western Pomerania [264,402], Wybrzeże Słowińskie (Slovincian Coast) [378], Wysoczyzna Białostocka (Białystok Highland) [272], Wysoczyzna Elbląska (Elbląg Highland) [273], Wysoczyzna Kaliska (Kalisz Highland) [274,275], Wysoczyzna Łaska (Łask Highland) [276], Wyżyna Lubelska (Lublin Upland) [87], Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland) [278], Wyżyna Sandomierska (Sandomierz Upland) [279], and Zaklesiość Sosnowicka (Sosnowica Depression) [282].

In comparison to other species of the genus *Opegrapha* s. l., *P. rufescens* is most widespread in the Polish lowlands, with a majority of its known localities in the northern and eastern parts of the country, mostly in Warmia, Masuria, the Nizina Podlaska (Podlachian Lowland), and Wyżyna Lubelska. In southern Poland, it is found in the western part of the Polish Carpathians and in the East Beskids (Fig. 71).

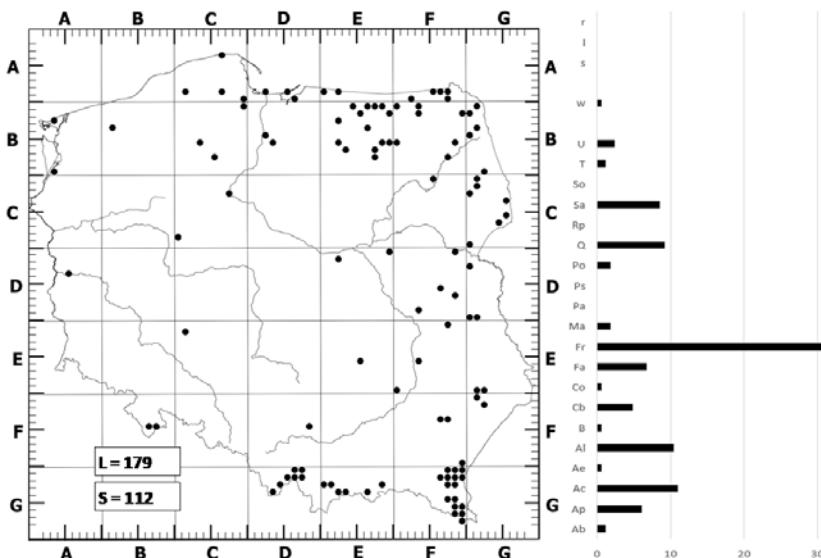

Fig. 71 Distribution and substrate preference of *Pseudoschismatomma rufescens* in Poland.

4.6.17. *Zwackhia sorediifera* (P. James) Ertz

in Diederich, Ertz, Eichler, Cezanne, Boom, Fischer, Killmann, van den Broeck & Sérusiau, Bull. Soc. Nat. Luemb. 113: 106 (2012).

≡ *Opegrapha sorediifera* P. James, Lichenologist 2: 86 (1962).

Thallus thin, partly sunken, with characteristic orange soralia. Ascomata black, unbranched, 0.2–0.7 × 0.1–0.3 mm, not pruinose, elevated, very rarely sunken. Discs black, narrow, rarely broad. Excipulum continuous below the hypothecium, 80–100 µm thick at the base, K+ olive-green. Hypothecium grey to grey-brown, dark, 10–15 µm high. Hymenium pale, 80–110 µm high, I+ reddish. Ascii club-shaped, 60–100 × 16–21 µm. Ascospores hyaline, spindle-shaped,

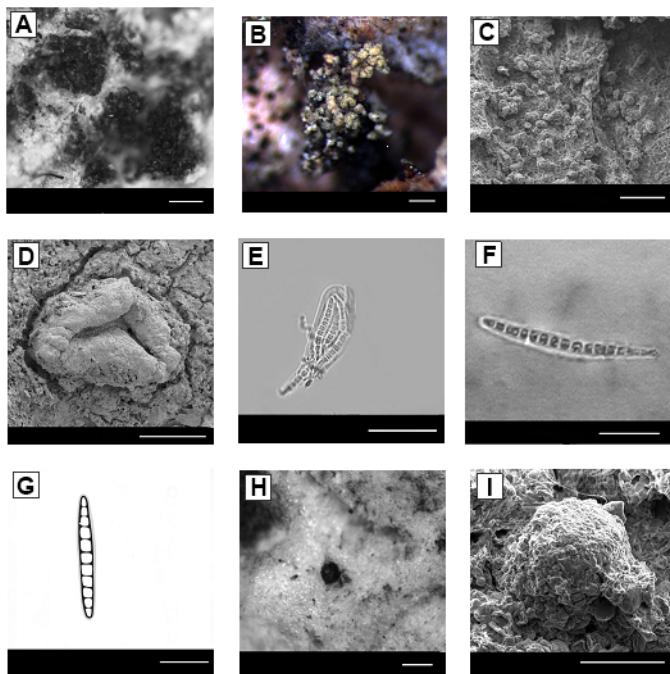

Fig. 72 *Zwackhia soredifera* (P. James) Ertz: (A,B) thallus with soredia, LM (leg. A. Wieczorek, 2014, herb. Wieczorek); (C) thallus with soredia, SEM (leg. A. Wieczorek, 2014, Sept. 22, herb. Wieczorek); (D) apothecia, SEM (leg. A. Wieczorek, 2014, herb. Wieczorek); (E) ascus with ascospore, LM (leg. A. Wieczorek, 2014, herb. Wieczorek); (F,G) ascospore, LM (leg. A. Wieczorek, 2014, herb. Wieczorek); (H) pycnidium, LM (leg. A. Wieczorek, 2014, herb. Wieczorek); (I) pycnidium, SEM (leg. A. Wieczorek, 2014, herb. Wieczorek). Scale bars: (A,B,G) 2 mm; (C) 200 µm; (D) 30 µm; (E) 15 µm; (F) 10 µm; (H) 40 µm; (I) 200 µm.

30–45 × 4–5 µm, 10–14-septate, with well-developed perispore of 0.5–0.9 µm thick. Pycnidia elevated or sessile, black. Conidia straight, 4–6 × 0.5–0.8 µm (Fig. 72). Soredia K–, C– or + reddish, PD–.

Discussion. *Zwackhia soredifera* is often mistaken with *Z. viridis*. Although both species grow together in mixed populations, they are relatively easy to distinguish. *Zwackhia soredifera* can be recognized due to its characteristic orange soralia, multicellular ascospores, and markedly thinner perispore. The minor diagnostic features of *Z. soredifera* are the shorter and slightly wider ascospores compared to *Z. viridis*. Because of its rarity in Poland, intraspecific variability cannot be assessed.

Nomenclatural notes. *Opegrapha soredifera* was described by James [403] based on specimens collected near Middleton in Ireland. In Europe, this taxon had been overlooked until recently. According to the latest taxonomic treatment, the species is now placed in the genus *Zwackhia* [29]. Both species in this genus, *Z. soredifera* and *Z. viridis*, differ from other species in the genus *Opegrapha* s. l. by their multicellular spindle-shaped ascospores and *vulgata*-type asci,

which are characterized by an inner layer of endoascus amyloid along most of its length and a conspicuous ring with no apical nasse.

Distribution outside Europe. This species is known from North America, recorded, e.g., from Canada [66].

Habitat and distribution in Europe. *Zwackhia sorediifera* was reported, e.g., from the Azores [404], Denmark [163], Estonia [123], France [405], Great Britain [92], Lithuania [173,174], and Norway and Sweden [97].

Habitat and distribution in Poland. This is the first record of *Z. sorediifera* reported from Poland. The species was found on the bark of *Fraxinus excelsior* and *Carpinus betulus* in extensive woodlands, in the northwestern part of the country (Fig. 73).

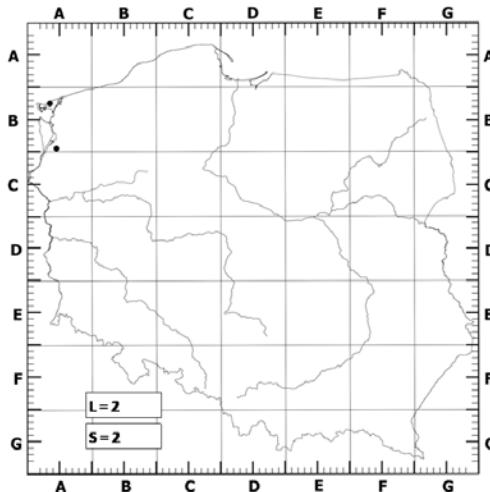

Fig. 73 Distribution of *Zwackhia sorediifera* in Poland.

4.6.18. *Zwackhia viridis* (Ach.) Poetsch & Schied.

System. Aufzähl. Samenlos. Pflanzen (Krypt.): 186 (1872).

= *Opegrapha rubella* var. *viridis* Ach., Methodus, Sectio prior Stockholmiae: 22 (1803).

= *Opegrapha viridis* (Ach.) Behlen & Desberger, Naturgesch. und Beschreib. Deutsch Forst.-Kryptog.: 110 (1835).

Thallus thin, often with lines of dark prothallus, smooth or delicately cracked in some parts, grey-brown. Ascomata numerous, solitary or in large groups, usually evenly distributed, unbranched or branched, 0.4–5.0 × 0.1–0.4 mm. Discs flat or convex, black and not pruinose, at early stages of development very narrow, but during maturation some of them widened. Excipulum edge thick, permanent, elevated, black, naked, continuous below the hypothecium,

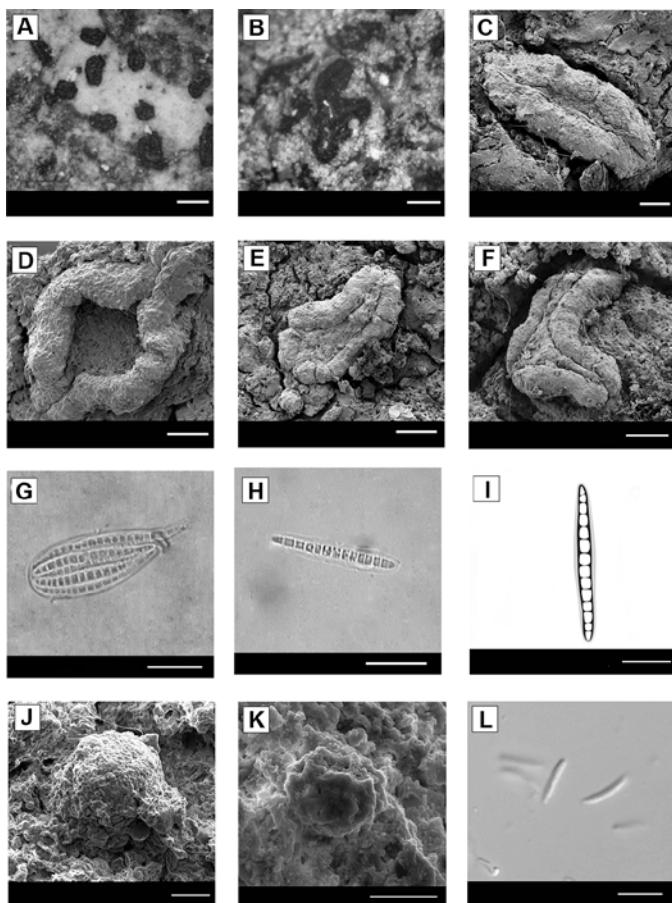

Fig. 74 *Zwackia viridis* (Ach.) Poetsch & Schied.: (A,B) thallus and ascocarps, LM [(A) leg. A. Wieczorek, 1997, herb. Wieczorek; (B) leg. W. Fałtynowicz & J. Miądlikowska UGDA-L 3496]; (C-F) thallus and ascocarps, SEM [(C,E) leg. A. Wieczorek, July 12, 1997, herb. Wieczorek; (D,F) leg. W. Fałtynowicz & J. Miądlikowska UGDA-L 3496]; (G) ascus with ascospores, LM (leg. A. Wieczorek, 1997, herb. Wieczorek); (H,I) ascospores, LM (leg. A. Wieczorek, 1997, herb. Wieczorek); (J,K) pycnidium, SEM (leg. W. Fałtynowicz & J. Miądlikowska, UGDA-L 3496); (L) conidia, LM (leg. W. Fałtynowicz & J. Miądlikowska, UGDA-L 3496). Scale bars: (A,B) 200 µm; (C-F) 200 µm; (G) 30 µm; (H,I) 20 µm; (J,K) 100 µm; (L) 10 µm.

20–60 µm thick laterally and 30–80 µm at the base. Hypothecium brownish, 10–35 µm high. Hymenium hyaline, ca. 40–85 µm high, I+ reddish-yellow. Pseudoepithecioid poorly developed. Asci club-shaped, mature 50–90 × 15–25 µm, young 30–50 × 10–15 µm – inner layer of endoascus amyloid nearly along its whole length, chamber small, with no apical nasse (*vulgata*-type). Ascospores hyaline, narrowly spindle-shaped, straight or slightly curved, (5)6–15-septate, 20–60 × 3–10 µm, with well-developed perispore of 1.5–2.0 µm thick. Pycnidia numerous, small, black. Conidia straight or slightly curved, 6–11 × 0.8–2 µm (Fig. 74). Chemistry: thalli K± dark rusty-brownish, C–, PD–.

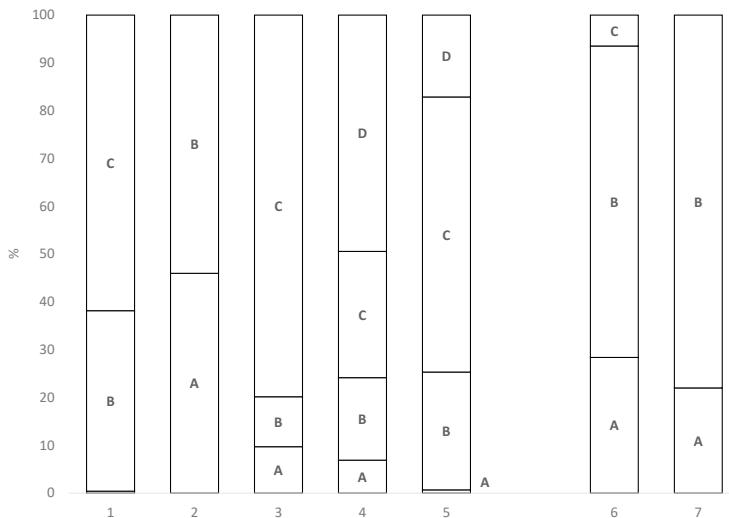

Fig. 75 Variation in selected morphological and anatomical features *Zwackhia viridis*
 1 – ascocarpa shape: A – circular, B – elliptic, C – elongate; 2 – ascocarpa: A – unbranched, B – branched; 3 – disc type: A – concave, B – flat, C – convex; 4 – thallus color: A – white, B – grey, C – white-grey, D – brownish; 5 – excipulum types; 6 – number of pycnidia: A – few, B – numerous, C – very numerous; 7 – type of pycnidia: A – sessile, B – convex.

Discussion. *Zwackhia viridis* is easy to recognize due to its very long and narrow, multicellular ascospores and its well-developed hyaline perispore. Its thallus habit and ascocarpa shape sometimes resemble *Opegrapha vulgata* and *O. niveoatra*, but the ascospore size and structure generally differ in the latter species.

Similar to other species with wide geographic ranges, *Zwackhia viridis* shows high phenotypic variability. Nowak [10] distinguished five forms of the species: for. *viridis*, for. *albicans* Kremp. ex Redgr., for. *perminuta* Erichs. ex Redgr. in herb., for. *subatra* Erichs. ex Redgr. in herb., and for. *ferruginea* (Kremp.) A. Zahlbr. The size and shape of ascocarps are highly variable in this species (Fig. 75), as is ascospore length (with a range from 20 µm to 60 µm), and the number of cells in ascospores. The majority of specimens (76) have 10-septate ascospores, followed by 47 specimens with 11-septate ascospores and 20 specimens with 12-septate ascospores. The remaining specimens have 13–15-septate ascospores [34].

A recent study on the genetic diversity of seven populations of *Z. viridis* revealed high intraspecific genetic variability in different regions of eastern Poland [406].

Nomenclatural notes. *Zwackhia viridis* was described by Acharius [17] in 1803, under the name *Opegrapha rubella* var. *viridis*. In 1814, the species name *O. viridis* began being used widely [3]. An old synonym for the species is *Lecanactis involuta* (Wallr.) A. Massal. [407]. In 1869, *O. viridis* was transferred to *Graphis* by Branth and Rostrup [408]. The species was treated by Poetsch and Schiedermayr [409], who due to its specific features, called it *Zwackhia viridis*, adopting the generic epithet from Körber [21]. Research by Ertz and Tehler [7] confirmed the genotypic differentiation of this taxon, and the genus *Zwackhia* was reinstated by the authors, who considered the morphological and anatomical structure of its representatives.

Distribution outside Europe. *Zwackhia viridis* has a wide geographic range, comprising Africa, North America, and Asia. It has been recorded, e.g., from China [144], Hong Kong [146], Korea [68], Taiwan [69], Morocco [65], Canada [66], and the USA [135,138,139,410].

Habitat and distribution in Europe. According to Wirth [38] and Wirth et al. [39], *Zwackhia viridis* occurs in Central European, Mediterranean, and sub-Atlantic regions. In Europe, it grows on the bark of deciduous trees, most often on *Quercus* spp., *Fraxinus excelsior*, *Fagus sylvatica*, and *Carpinus betulus*. Occasionally it can be found on coniferous trees.

It has been recorded, e.g., from Austria [71], the Czech Republic [295], Denmark [122,163], Estonia [411], Germany [168,412], Great Britain [92], Hungary [93], Latvia [172], Lithuania [175,413], Romania [178,179], Sweden and Norway [128], Switzerland [129], and Ukraine [100].

Habitat and distribution in Poland. *Zwackhia viridis* grows mostly on the bark of *Fagus sylvatica*, *Carpinus betulus*, and *Fraxinus excelsior*, in well-preserved forests of Poland. It is found less frequently on isolated trees or in open forests, such as on *Betula* spp., *Acer* spp., *Quercus* spp., or *Populus* spp. Occasionally, it is found on *Abies alba* [367]. *Zwackhia viridis* grows on trees whose bark is moderately acidic to neutral, with pH 4.9–7.0. It grows in the shade, preferring moist habitats [38].

The first records of *Zwackhia viridis* were published by Körber [21], Ohlert [77], Stein [182], Eitner [303,347], and Lettau [78]. It was reported from Galicia [185], the Beskid Mały Mountains [321], Beskid Niski Mountains [188,322], Beskid Sądecki Mountains [102,323], Beskid Śląski Mountains [189,190], Beskid Lesiste Mountains [191], Bory Tucholskie (Tuchola Forest) [194,195], Dolina Dolnego Sanu (Lower San River Valley) [104,397], Dolina Konińska (Konin Valley) [194], Dolina Wisły (Vistula Valley) [394], Dolny Śląsk (Lower Silesia Province) [132], Gorce Mountains [349,414], Stołowe Mountains [198], Świętokrzyskie Mountains [199–201], Kotlina Gorzowska (Gorzów Basin) [395], Kotlina Orawsko-Nowotarska (Orava-Nowy Targ Basin) [362], Kotlina Żywiecka (Żywiec Basin) [207], Łąćuch Tatrzanski macroregion [210,211], Masyw Śleży (Śleża Massif) [213], Mierzeja Wiślana (Vistula Spit) [215], Niecka Włoszczowska (Włoszczowa Basin) [216]. Nizina Mazowiecka (Mazovian Lowland) [217], Padół Zamojski (Zamość Depression) [223], Pieniny Mountains [110,111,219], Płaskowyż Nałęczowski (Nałęczów Plateau) [220], Pobrzeże Kaszubskie (Kashubian Coastland) [83,221], Pobrzeże Szczecińskie (Szczecin Coastland) [80,222], Podgórze Rzeszowskie (Rzeszów Foothills) [223], Pogórze Przemyskie (Przemyśl Foothills) [112], Pogórze Rożnowsko-Cieżkowickie (Rożnowsko-Cieżkowickie Foothills) [81], Pogórze Spiskie (Spisz Foothills) [225], Pojezierze Ełckie (Ełk Lakeland) [82,305,399], Pojezierze Gnieźnieńskie (Gniezno Lake District) [227–229], Pojezierze Iławskie (Iława Lake District) [231], Pojezierze Kaszubskie (Kashubian Lake District) [232], Pojezierze Krajeńskie (Krajna Lake District) [233], Pojezierze Olsztyńskie (Olsztyn Lake District) [235,353], northeastern Poland [218], Pradolina Wieprza (Wieprz River Ustromtal) [237], Równina Łukowska (Łuków Plain) [251], Roztocze [255,256,258], Równina Augustowska (Augustów Plain) [239,241,242,307], Równina Bielska (Bielsk Plain) [55,243], Równina Biłgorajska (Biłgorajska Plain) [308], Równina Drawska (Drawno Plain) [85,244], Równina Kozienicka (Kozienice Plain) [245,372,400], Równina Łęczyńsko-Włodawska (Łęczna-Włodawa Plain) [247], Równina Łowicko-Błońska (Łowicz-Błonie Plain) [249], Równina Piotrkowska (Piotrków Plain) [252,253], Równina Słupska (Słupsk Plain) [86], Sudetes [259–261,367],

Śląsk Opolski (Opole Silesia) [262], West Beskids [131,190,191], West Bieszczady Mountains [309,355,376], Western Pomerania [84,264,402], Wybrzeże Śląskie (Slovincian Coast) [378], Wysoczyzna Białostocka (Białystok Highland) [271,272,356], Wysoczyzna Elbląska (Elbląg Highland) [273], Wysoczyzna Kaliska (Kalisz Highland) [274,275], Wysoczyzna Łaska (Łask Highland) [276], Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland) [278], Wyżyna Lubelska (Lublin Upland) [87], Wyżyna Sandomierska (Sandomierz Upland) [279], and Zakłębłość Sosnowicka (Sosnowica Depression) [282].

Zwackhia viridis is one of the most frequent epiphytic species in Poland, and it is distributed in both lowlands and uplands [e.g., the Pojezierze Pomorskie (Pomeranian Lake District), Warmia and Masuria, Wyżyna Małopolska (Lesser Poland Upland), and Wyżyna Lubelska) as well as in the mountains (Tatras, Beskids, and Bieszczady Mountains) (Fig. 76). Herbarium specimen labels indicate that in the Tatras, it is frequent in both the lower and upper montane belts, but it reaches the subalpine belt (altitudes of up to about 1,700 m).

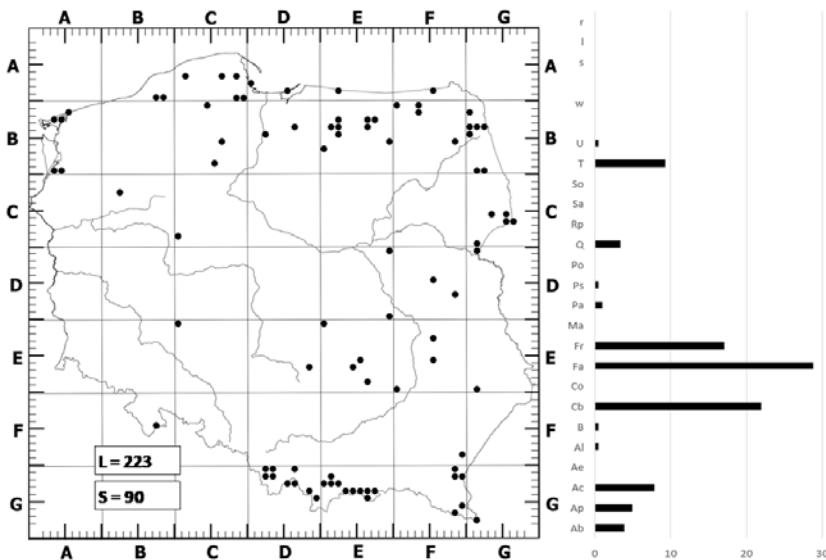

Fig. 76 Distribution and substrate preference of *Zwackhia viridis* in Poland.

5. Summary of results and conclusions

- About 1,400 specimens of the genus *Opegrapha* s. l. were examined from the Polish herbaria (BDPA, KRA, KRAM, KRAP, KTC, LBL, LOD, OLTC, POZ, TRN, UGDA, WA, WRSL), from private collections, and obtained during the author's field research. Reference material from several European herbaria also was studied (e.g., BILAS, GSU, NNSU, OHHI, WI).

- In total, 18 species of the genus *Opegrapha* s. l. were found to occur in Poland, including, eight of the genus *Opegrapha* s.s, four of the genus *Alyxoria*, two of the genus *Arthonia*, two of the genus *Zwackhia*, one of the genus *Gyrographa*, one of the genus *Phacographa*, and one of the genus *Pseudoschismatomma*.
- *Zwackhia sorediifera* is reported from Poland for the first time.
- An identification key for the species of the genus *Opegrapha* s. l. found in Poland was compiled based on morphological and anatomical characters.
- Most of the species in the genus *Opegrapha* s. l. in Poland are simple to identify. The only exception is *Arthonia calcarea*, as its ascospores are of similar size and shape to those of *O. saxicola*. However, *A. calcarea* differs from *O. saxicola* by having a narrow perispore and different ascus structure.
- Within the genus *Alyxoria*, the shape of the hymenial disc and ascomata varied widely, so the characters do not seem to be good diagnostic features.
- In the genus *Opegrapha*, conidia size and shape are the most reliable diagnostic characters at the species level.
- All species of genus *Opegrapha* s. l. grow on natural substrates in Poland.
- Out of the 18 species, 10 are epiphytes that grow on the bark of various tree species, including: *Alyxoria culmigena*, *A. ochrocheila*, *A. varia*, *Arthonia atra*, *Opegrapha niveoatra*, *O. vermicellifera*, *O. vulgata*, *Pseudoschismatomma rufescens*, *Zwackhia sorediifera*, and *Z. viridis*.
- The epilithic species of the genus *Opegrapha* s. l. are *Alyxoria mougeotii*, *Arthonia calcarea*, *Gyrographa gyrocara*, *Opegrapha dolomitica*, *O. lithyrga*, and *O. saxicola*, and they occur predominantly in the south of the country.
- New regional records for the number of species extended our knowledge of their distribution in Poland.
- Several species are rare in Poland and are known only from a few localities. These include *Alyxoria culmigena*, *A. mougeotii*, *A. ochrocheila*, *Arthonia calcarea*, *Opegrapha dolomitica*, *O. geographicola*, *O. lithyrga*, *Phacographa glaucomaria*, and *Zwackhia sorediifera*.
- A large number of the examined specimens originated from the northeastern and southern parts of Poland, likely a consequence of the more intensive collecting activity there compared to other areas.

1. Appendix: list of examined herbarium specimens, literature records, and list of surveyed localities

Alyxoria culmigena (Lib.) Ertz

Specimens examined. AB-84 – Pobrzeże Szczecińskie (Szczecin Coastland), Wzgórza Bukowe (Beech Hills): Szczecin Landscape Park, Puszcza Bukowa (Beech Forest), *Fagus sylvatica*, forest section No. 240, July 1997, leg. A. Wieczorek (herb. Wieczorek). AC-48 – Pojezierze Południowopomorskie (South Pomeranian Lake District), Równina Gorzowska (Gorzów Plain): Puszcza Barlinecka (Barlinek Forest), Wilanów Nature Reserve, *Populus* spp., December 3, 1989, leg. L. Lipnicki (herb. Lipnicki).

Additional material examined. BELARUS: Gomel Region, Gomel District, Pribor forest, 52°22'N, 30°45'E, *Vaccinium myrtillus*-type old-growth pine forest, *Pinus* sp., October 10, 2012, leg. A. Tsurykau 01382 (GSU); Kalinino forest, 52°15'N, 30°59'E, *Pleurozium schreberi*-type pine forest, *Pinus* sp., October 2, 2012, leg. A. Tsurykau 01383 (GSU); Kalinino forest, 52°15' N, 30°59'E, *Pleurozium schreberi*-type pine forest, *Pinus* sp., August 3, 2011, leg. A. Tsurykau, 01439 (GSU); Kalinino forest, 52°15' N, 30°58'E, *Pteridium aquilinum*-type pine forest, *Pinus* sp., August 3, 2011, leg. A. Tsurykau 01440 (GSU). FRANCE: forêt de Hardelot, *Quercus* sp., August 29, 1954, leg. J. Barkman. RUSSIA: Orel region, T. 204, Khotynetsky distr., Orlovskoye Polesie National Park, Łgovskoye Forest Division, dried wood, 53°17.249' N, 35°20.544' E, alt. 239 m, June 9, 2012, leg. E. E. Muchnik 9635 (OHHI).

Alyxoria mougeotii (A. Massal.) Ertz, Frisch & G. Thor

Specimens examined. DF-48 – Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland), Wyżyna Olkuska (Olkusz Upland): Ojców village, Dolina Sąspowska (Sąspowska Valley), limestone, May 1, 1956, leg. J. Nowak (KRAM-L 4128). DF-58 – Wyżyna Krakowsko-Częstochowska (Kraków-Częstochowa Upland), Wyżyna Olkuska (Olkusz Upland): Kochanów village near Rudawa village, limestone, August 6, 1956, leg. J. Nowak (KRAM-L 4132); Ojców National Park, Dolina Prądnika (Prądnik River Valley), rock, May 3, 2005, leg. J. Kiszka (KRAP); Dolina Sąspowska (Sąspowska Valley), Jarki Gorge, rock, September 29, 2005, leg. J. Kiszka (KRAP). EE-82 – Wyżyna Kielecka (Kielce Upland), Świętokrzyskie Mountains: Polichno village, limestone, April 10, 1977, leg. Sepski (KTC). EG-32 – Obniżenie Orawsko-Podhalańskie (Orava-Podhale Depression), Pieniny Mountains: rocks in Czorsztyn village, limestone, October 11, 1993, leg. J. Kiszka (KRAP); Zielone Skałki, on N from Falsztyn village, limestone, August 18, 1995, leg. J. Kiszka (KRAM-L 60008). EG-33 – Obniżenie Orawsko-Podhalańskie (Orava-Podhale Depression), Pieniny Mountains: Wąwóz Szopczański [Sobczański] (Szopczański Gorge), limestone, September 11, 1957, leg. K. Glanc (KRAM-L 39372); Wąwóz Szopczański [Sobczański] (Szopczański Gorge), alt. 560 m, limestone, September 18, 1957, leg. Z. Tobolewski (POZ); limestone, August 6, 1954, leg. Z. Tobolewski (POZ). EG-36 – West Beskids, Beskid Sądecki Mountains: Pasmo Jaworzyny Krynickiej (Jaworzyna Krynicka Range), sandstone, August 23, 1985, leg. A. Wieczorek (herb. Wieczorek).

FF-98 – Pogórze Środkowobeskidzkie (Central Beskidian Foothills), Pogórze Przemyskie (Przemyśl Foothills): Krzeczkowa village, rock, stones, May 22, 1986, leg. J. Piórecki (BDPA). **FF-99** – Pogórze Środkowobeskidzkie (Central Beskidian Foothills), Pogórze Przemyskie (Przemyśl Foothills): Przemyśl City, on the way to Kruhel Wielki village, No. 127, concrete wall, October 16, 1996, leg. J. Kiszka (KRAM-L 60007).

Additional material examined. GREAT BRITAIN: Chudleigh cave, S Devon, on basic rock in deep shade, August 15, 1975, leg. C. J. B. Hitch (herb. Seaward).

Alyxoria ochrocheila (Nyl.) Ertz & Tehler

Specimens examined. **DG-24** – West Beskids, Beskid Żywiecki Mountains: Rysianka Mount, *Fagus sylvatica*, July 3, 1978, leg. J. Kiszka & J. Nowak (KRAM-L 17736); Hala Rysianka, *Fagus sylvatica*, September 7, 1964, leg. J. Nowak (KRAM-L 17579). **EE-09** – Nizina Środkowomazowiecka (Central Mazovian Lowland), Równina Kozienicka (Kozienice Plain): Puszcza Kozienicka (Kozienice Forest), Jedlnia Nature Reserve, *Quercus* sp., September 1, 2003, leg. S. Cieśliński (KTC). **EE-60** – Wyżyna Przedborska (Przedborska Upland), Wzgórza Łopuszańskie (Łopuszańskie Hills), Oleszno Nature Reserve, forest section No. 53, *Acer pseudoplatanus*, February 2008, leg. A. Donica (KTC). **FE-75** – Wyżyna Lubelska (Lublin Upland), Wzniesienia Urzędowskie (Urzędów Hills): Trzydnik village near Kraśnik village, *Carpinus betulus*, 1975, leg. Z. Flisińska (LBL).

Additional material examined. DENMARK: Bornholm, Dondalen, forest, *Carpinus betulus*, July 5, 2014, leg. A. Wieczorek & A. Łysko (herb. Wieczorek). **GERMANY:** Schleswig-Holstein, Ostholstein, Fehmarn, Staberhuk, Staber Holz, *Sambucus nigra*, October 30, 2010, leg. U. Schiefelbein 2468 (herb. Schiefelbein); Mecklenburg-Vorpommern, Landkreis Mecklenburg-Strelitz, Schlosspark, Mirow, concrete, November 2, 2002, leg. U. Schiefelbein 1213 (herb. Schiefelbein); Vorpommern-Rügen, Isle of Rügen, forest Goor, ca. 1 km E of Badehaus, alt. 15 m, *Carpinus betulus*, October 24, 2014, leg. U. Schiefelbein 3732 (herb. Schiefelbein); Niedersachsen, Landkreis Cloppenburg, NSG Urwald Baumweg, *Carpinus betulus*, October 25, 2004, leg. U. Schiefelbein 1887 (herb. Schiefelbein).

Alyxoria varia (Pers.) Ertz & Tehler

Specimens examined. **BA-59** – Pobrzeże Koszalińskie (Koszalin Coastland), Wybrzeże Słowińskie (Slovincian Coast): Orzechowo village near Ustka town, *Fagus sylvatica*, July 17, 1986, leg. W. Fałtynowicz (UGDA-L 2824) as *O. variaeformis*. **BA-98** – Pobrzeże Koszalińskie (Koszalin Coastland), Równina Słupska (Słupsk Plain): Chomiec village near Janiewice village, *Fagus sylvatica*, August 27, 1987, leg. W. Fałtynowicz & J. Miądlikowska (UGDA-L 3893) as *O. variaeformis*. **BB-23** – Pobrzeże Koszalińskie (Koszalin Coastland), Równina Białogardzka (Białogard Plain): Krępa village near Białogard town, *Acer* sp., October 17, 1987, leg. W. Fałtynowicz (KRAM-L 21815, UGDA-L 3602) as *O. variaeformis*. **BB-59** – Pojezierze Południowopomorskie (South Pomeranian Lake District), Dolina Gwdy (Gwda River Valley); Cisy w Czarnem Nature Reserve, beech forest, *Fagus sylvatica*, November 13, 2004, leg. M. Kukwa 3709 (UGDA-L 12641). **BC-12** – Pojezierze Południowopomorskie (South Pomeranian Lake District), Równina Drawska (Drawno Plain): Drawieński Park Narodowy

(Drawa National Park), Tragankowe Urwisko Nature Reserve, E slopes of Drawa River, ca. 2 km NE of Zatom village, *Fagus sylvatica*, May 6, 2010, leg. U. Schiebelbein 2617, 2625 (herb. Schiebelbein). **BC-22** – Pojezierze Południowopomorskie (South Pomeranian Lake District), Równina Drawska (Drawno Plain): Drawieński Park Narodowy (Drawa National Park), Ostrowiec Lake, Okrzesi Island, *Fagus sylvatica*, August 17, 1989, September 18, 1989, leg. L. Lipnicki (herb. Lipnicki); decaying wood, May 27, 1989, leg. L. Lipnicki (herb. Lipnicki); Województwo lubuskie (Lubusz Province), *Acer pseudoplatanus*, May 7, 2010, leg. U. Schiebelbein 2670 (herb. Schiebelbein); Dąbrowa village, ca. 2 km E of Moczele, *Populus tremula*, May 7, 2010, leg. U. Schiebelbein 2642 (herb. Schiebelbein); Wydrzy Głąz Nature Reserve, ca. 3 km N of Moczele village, *Fagus sylvatica*, May 8, 2010, leg. U. Schiebelbein 2721 (herb. Schiebelbein). **BC-32** – Pojezierze Południowopomorskie (South Pomeranian Lake District), Równina Drawska (Drawno Plain): Drawieński Park Narodowy (Drawa National Park), by Płociczna River, forest section No. 253, *Carpinus betulus*, August 17, 1989, leg. L. Lipnicki (herb. Lipnicki). **BC-46** – Pradolina Toruńsko-Eberswaldzka (Toruń-Eberswalder Urstromtal), Kotlina Gorzowska (Gorzów Basin): Noteć region, near Czarnków town, *Ulmus laevis*, March 12, 1967, leg. K. Glanc (KRAM-L 39090). **BD-96** – Obniżenie Milicko-Głogowskie (Milicz-Głogów Depression), Kotlina Żmigrodzka (Żmigród Basin): Kowalowo village, *Populus* sp., May 21, 1969, leg. K. Glanc (KRAM-L 39069). **BF-37** – Eastern Sudetes, Góry Złote (Golden Mountains): Łądek Zdrój town, decaying wood, July 23, 1997, leg. E. Koziół (WRSŁ). **BF-47** – Eastern Sudetes, Masyw Śnieżnika (Śnieżnik Massif): Bialskie Mountains, Dolina Kleśnicy (valley of Kleśnica Stream), *Acer* sp., June 30, 2001, leg. K. Szczepańska (herb. Szczepańska); Puszcz Jaworowa Nature Reserve, *Fagus sylvatica*, July 8, 2003, leg. K. Szczepańska (herb. Szczepańska); *Acer* sp., July 8, 2003, leg. K. Szczepańska (herb. Szczepańska). **BF-48** – Eastern Sudetes, Góry Złote (Golden Mountains): Nowa Morawa village, roadside trees, September 18, 1992, leg. E. Koziół (WRSŁ); above Bielice village, old tree, September 20, 1991, leg. E. Koziół (WRSŁ). **CA-36** – Pobrzeże Koszalińskie (Koszalin Coastland), Wybrzeże Słowińskie (Slovincian Coast): Białogóra village, forest section No. 25Z, *Fagus sylvatica*, July 29, 1982, leg. W. Fałtynowicz (UGDA-L 4236) as *O. variaeformis*. **CA-37** – Pobrzeże Koszalińskie (Koszalin Coastland), Pradolina Redy-Łeby (Reda-Łeba Urstromtal): ca. 2 km of Wejherowo town, near road to Krokowa village, *Acer* sp., April 16, 1983, leg. A. Zalewska (UGDA-L 2880) as *O. variaeformis*. **CA-51** – Pobrzeże Koszalińskie (Koszalin Coastland), Wysoczyzna Damnicka (Damnica Highland): Smoldzino village, March 19, 1995, leg. W. Fałtynowicz (herb. Seaward). **CA-58** – Pobrzeże Koszalińskie (Koszalin Coastland), Pradolina Redy-Łeby (Reda-Łeba Urstromtal): ca. 4 km N of Wejherowo town, *Ulmus* sp., July 15, 1983, leg. A. Zalewska (UGDA-L 2869). **CA-66** – Pojezierze Wschodniopomorskie (East Pomeranian Lake District), Pojezierze Kaszubskie (Kashubian Lake District): 1.5 km S of Porzecze village, *Carpinus betulus*, July 11, 1985, leg. Kubiak (OLTC); *Carpinus betulus*, October 21, 2000, leg. D. Kubiak (OLTC). **EB-59** – Pojezierze Mazurskie (Masurian Lake District), Pojezierze Olsztyńskie (Olsztyn Lake District): Strzałowo Nature Reserve, *Tilia cordata*, September 1, 1987, leg. S. Cieśliński (KTC); Puszcza Piska (Pisz Forest), Krutynia Nature Reserve, *Acer* sp., August 31, 1981, leg. S. Cieśliński (KTC); *Carpinus betulus*, August 31, 1987, leg. S. Cieśliński (KTC). **EB-60** – Pojezierze Mazurskie (Masurian Lake District), Pojezierze Olsztyńskie (Olsztyn Lake District): ca. 2 km E of Stare Jabłonki railway station, *Tilia cordata*, September 20, 1994, leg. S. Cieśliński (KTC). **ED-09** – Nizina Środkowomazowiecka (Central Mazovian Lowland), Kotlina Warszawska (Warsaw Basin), Równina Wołomińska (Wołomin Plain): Dębina Nature Reserve, *Carpinus betulus*, September 1955, leg. J. Zielińska (WA). **ED-99** – Nizina Środkowomazowiecka (Central Mazovian Lowland), Równina Kozienna (Koziennice Plain): Puszcza Kozienna (Koziennice Forest), Zagoźdżon Nature Reserve, *Carpinus betulus*, July 25, 1968, leg. S. Cieśliński (KTC). **EE-00** – Wzniesienia Południowomazowieckie (South Mazovian Hills), Równina Piotrkowska (Piotrków Plain):

Puszcza Pilicka (Pilica Forest), Spała Nature Reserve, forest section No. 286, *Carpinus betulus*, in oak-linden-hornbeam forest, April 28, 1969, leg. K. Czyżewska (LOD-L 525). **EE-55** – Wyżyna Kielecka (Kielce Upland), Płaskowyż Suchedniowski (Suchedniów Plateau): Suchedniów Forest District, Dalejów Nature Reserve, *Acer pseudoplatanus*, July 1989, leg. Pańczyk & K. Toborowicz (KTC). **EE-64** – Wyżyna Kielecka (Kielce Upland), Świętokrzyskie Mountains: Gruchawka near Kielce City, Sufraganiec Nature Reserve, *Abies alba*, October 22, 1972, leg. K. Toborowicz (KTC). **EE-86** – Wyżyna Kielecka (Kielce Upland), Świętokrzyskie Mountains: Stołowa Góra (Stołowa Mount), *Carpinus betulus*, July 12, 1964, leg. S. Cieśliński (KTC). **EG-11** – West Beskids, Gorce Mountains: Kudłoń Mount, near Adamówka village, *Fagus sylvatica*, August 24, 1968, leg. K. Glanc (KRAM-L 39400). **EG-20** – West Beskids, Gorce Mountains: under Obidowiec Mount, Ścisłe Brzyzki Forest District, in Olszowy Potok (Olszowy Stream) catchment area, *Fagus sylvatica*, November 9, 1994, leg. P. Czarnota (GPN 679); under Obidowiec glade, in valley of Olszowy Potok (Olszowy Stream), *Fagus sylvatica*, July 4, 1994, leg. P. Czarnota (GPN 659); near Paciepnica Stream, leg. P. Czarnota (GPN 989); W slope of Suhora Mount, *Abies alba*, September 10, 1959, leg. K. Glanc (KRAM-L 39384); *Fagus sylvatica*, September 10, 1959, leg. K. Glanc (KRAM-L 39399). **EG-21** – West Beskids, Gorce Mountains: Turbacz Mount S slope, Kliczka forest, *Fagus sylvatica*, August 24, 1966, leg. K. Glanc (KRAM-L 39405); Gorc Mount, W slope, alt. 900 m, *Fagus sylvatica*, September 08, 1959, leg. K. Glanc (KRAM-L 35859); Dolina Łopusznej (Łopuszna Valley), *Fagus sylvatica*, August 23, 1965, leg. K. Glanc (KRAM-L 39401); under peak of W slope of Turbacz Mount, *Fagus sylvatica*, September 6, 1964, leg. K. Glanc (KRAM-L 39392); Turbacz Nature Reserve, on N slope of Turbacz Mount, Olszowy Potok (Olszowy Stream), *Fagus sylvatica*, June 27, 1966, leg. K. Glanc (KRAM-L 39388); in Łopuszanka Stream, leg. P. Czarnota (GPN 1018); Turbacz Nature Reserve, in valley of Olszowy Potok (Olszowy Stream), *Fagus sylvatica*, June 23, 1994, leg. P. Czarnota (GPN 598); Hucisko Forest District, on W slope of Gorc Porębski glade, Dolina Kamienicy (Kamienica River Valley), *Acer pseudoplatanus* July 11, 1994, leg. P. Czarnota (GPN 772); Znaki Forest District, Dolina Kamienicy (Kamienica River Valley), leg. P. Czarnota (GPN 1684); Turbacz Nature Reserve, near blue tourist trail, under Polana Średnie (Średnie Glade), in valley of Turbacz Stream, *Fagus sylvatica*, June 18, 1996, leg. P. Czarnota (GPN 1003, 1099); Szerokie Forest District, on S slope of Gorc glade in Dolina Kamienicy (Kamienica River Valley), under Gonadrowe Polanki, *Fagus sylvatica*, July 14, 1994, leg. P. Czarnota (GPN 759); Turbacz Mount, valley of Turbacz Stream, under Polana Średnie (Średnie Glade), *Fagus sylvatica*, May 23, 1996, leg. P. Czarnota (GPN 1296, GPN 1231); Turbacz Nature Reserve, under Polana Średnie (Średnie Glade), in valley of Olszowy Potok (Olszowy Stream), *Fagus sylvatica*, June 23, 1994, leg. P. Czarnota (GPN 639); Turbacz Mount, Łocha Forest District, in valley of Olszowy Potok (Olszowy Stream), leg. P. Czarnota (GPN 1113, 1048); near blue tourist trail, near Kamienica Stream, leg. P. Czarnota (GPN 965, 968, 1391); near Wspólny Potok (Wspólny Stream), in Dolina Kamienicy (Kamienica River Valley), *Fagus sylvatica*, June 9, 1997, leg. P. Czarnota (GPN 1647); near Roztoka Stream, leg. P. Czarnota (GPN 812, 814); Turbacz Nature Reserve, in Dolina Roztoki (Roztoka Stream Valley), leg. P. Czarnota (GPN 1557, 1014); at the hiking trail on Turbacz Mount, *Fagus sylvatica*, September 13, 1959, leg. K. Glanc (KRAM-L 39378); Lepietnica Forest District, *Fagus sylvatica*, September 12, 1964, leg. K. Glanc (KRAM-L 39390); S slope of Turbacz Mount, Dolina Łopusznej valley, *Fagus sylvatica*, August 24, 1966, leg. K. Glanc (KRAM-L 39402). **EG-22** – West Beskids, Gorce Mountains: Lubań Mount, S slope, valley of Skalny Stream, from Lubań Mount to Grywałd village, *Fagus sylvatica*, May 10, 1959, leg. K. Glanc

(KRAM-L 39386, 39379); Lubań Mount, slope N, from Tokarnia village on Lubań Mount, *Fagus sylvatica*, September 4, 1960, leg. K. Glanc (KRAM-L 39381); valley of Forędówka Stream, *Fagus sylvatica*, April 2, 1959, leg. K. Glanc (KRAM-L 39398). **EG-33** – Obniżenie Orawsko-Podhalańskie (Orava-Podhale Depression), Pieniny Mountains: Sokola Perć Mount, *Fagus sylvatica*, July 1, 1955, leg. Z. Tobolewski (POZ); Czertezik Mount, *Abies alba Fagus sylvatica*, September 14, 1957, leg. K. Glanc (KRAM-L 39375). **EG-34** – West Beskids, Beskid Sądecki Mountains: Pasmo Radziejowej (Radziejowa Range), nature reserve above Kotelnicy Potok (Kotelnicy Stream), *Fagus sylvatica*, September 9, 1976, leg. U. Bielczyk (KRAM-L 42068); Baniska Nature Reserve, *Fagus sylvatica*, September 25, 1967, leg. M. Olech (KRA); July 23, 1990, leg. L. Śliwa (KRA); valley of Potok Kozłecki (Kozlecki Stream), *Fagus sylvatica*, June 15, 1965, leg. M. Olech (KRA); valley of Mała Roztoka Stream, *Fagus sylvatica*, August 24, 1968, leg. M. Olech (KRA). **EG-35** – West Beskids, Beskid Sądecki Mountains: valley of Czercz Stream, *Fagus sylvatica*, August 4, 1990, leg. L. Śliwa (KRA). **EG-36** – West Beskids, Beskid Sądecki Mountains: Pasmo Jaworzyny (Jaworzyna Range), valley of Potok Łososioski (Łososioski Stream), *Fagus sylvatica*, October 14, 1967, leg. M. Olech (KRA); Kopiec Mount, S slope, *Fagus sylvatica*, September 9, 1967, leg. M. Olech (KRA); Jaworzyna Krynicka Mount, *Fagus sylvatica*, July 12, 1995, leg. A. Wieczorek (herb. Wieczorek). **EG-37** – West Beskids, Beskid Sądecki Mountains: valley of Kryściorów Stream, *Abies alba*, July 18, 1967, leg. M. Olech (KRA). **EG-46** – West Beskids, Beskid Sądecki Mountains: Muszyna town, *Fagus sylvatica*, August 12, 1953, leg. J. Rydzak (LBL). **FA-85** – Pojezierze Litewskie (Lithuanian Lake District), Puszcza Romincka (Romincka Forest): forest section No. 91, *Fraxinus* sp. May 16, 1985, leg. S. Cieśliński (KRAM-L 31842; KTC). **FB-00** – Pojezierze Mazurskie (Masurian Lake District), Kraina Wielkich Jezior Mazurskich (Great Masurian Lakes Land): Mokre village, forest section No. 281, *Quercus* sp., 3 September. 1989, leg. S. Cieśliński (KTC). **FB-03** – Pojezierze Mazurskie (Masurian Lake District), Pojezierze Ełckie (Ełk Lakeland): Puszcza Borecka (Borki Forest), nature reserve, *Carpinus betulus*, May 14, 1958, leg. K. Glanc (KRAM-L 39394, 39397); Puszcza Borecka (Borki Forest), near Czerwony Dwór village, forest section No. 195, *Fraxinus* sp., May 21, 1985, leg. S. Cieśliński (KTC); Puszcza Borecka (Borki Forest), forest section Nos 10, 205/206, 211/212, *Fraxinus* sp., May 21, 1985, leg. S. Cieśliński (KTC); forest section No. 10, *Carpinus betulus*, May 19, 1987, leg. Z. Tobolewski & S. Cieśliński (KTC). **FB-13** – Pojezierze Mazurskie (Masurian Lake District), Pojezierze Ełckie (Ełk Lakeland): Puszcza Borecka (Borki Forest), Borki Nature Reserve, *Tilia* sp., May 19, 1987, leg. S. Cieśliński (KTC); forest section No. 172/173, *Acer* sp., May 20, 1987, leg. S. Cieśliński (KTC). **FB-58** – Nizina Północnopodlaska (North Podlachian Lowland), Kotlina Biebrzańska (Biebrza Basin): Czerwone Bagno Nature Reserve, forest section No. 246, *Tilia cordata*, 24 September. 1986, leg. S. Cieśliński (KTC). **FD-45** – Nizina Południowopodlaska (South Podlachian Lowland), Równina Łukowska (Łuków Plain): Jata Nature Reserve near Łuków town, *Alnus glutinosa*, June 23, 1971, leg. M. Motyka-Zgłobicka (LBL). **FD-68** – Polesie Zachodnie (Western Polesie), Zaklesiość Łomaska (Łomaska Depression): Omelno Nature Reserve, *Quercus* sp., May 15, 1973, leg. B. Ordyczyńska (UMCS). **FE-25** – Wyżyna Lubelska (Lublin Upland), Płaskowyż Nałęczowski (Nałęczów Plateau): Wojciechowski Las near Nałęczów town, 1975, leg. Z. Flisińska (KTC). **FE-55** – Wyżyna Lubelska (Lublin Upland), Wzniesienia Urzędowskie (Urzędów Hills): Urzędów town, *Carpinus betulus*, 1975, leg. Z. Flisińska (UMCS). **FE-90** – Wyżyna Kielecka (Kielce Upland), Wyżyna Sandomierska (Sandomierz Upland): Żyznów near Klimontów village, forest section No. 72, *Acer pseudoplatanus*, 1984, leg. S. Cieśliński & Z. Taborowicz (KTC). **FF-89** – Pogórze Środkowobeskidzkie (Central Beskidian Foothills), Pogórze

Dynowskie (Dynowskie Foothills): Holubla Stream, *Fraxinus excelsior*, September 27, 1983, leg. J. Kiszka & J. Piórecki (KRAM-L 60065). **FG-08** – Pogórze Środkowobeskidzkie (Central Beskidian Foothills), Pogórze Przemyskie (Przemyśl Foothills): valley of Holubla Stream, *Fraxinus* sp., 27 September. 1983, leg. J. Kiszka & J. Piórecki (KRAM-L 30502). **FG-18** – Pogórze Środkowobeskidzkie (Central Beskidian Foothills), Pogórze Przemyskie (Przemyśl Foothills): crest of Chwaniów Mount, *Acer pseudoplatanus*, June 3, 1987, leg. J. Piórecki (BDAP). **FG-19** – Beskidy Lesiste Mountains, Góry Sanocko-Turczańskie (Sanok-Turka Mountains): Jamna Gora village, forest No. 2292, *Acer pseudoplatanus*, July 27, 1984, Leg. J. Kiszka & J. Piórecki (KRAM-L 60068). **FG-59** – Beskidy Lesiste Mountains, West Bieszczady Mountains: Nasiczne village, *Fagus sylvatica*, July 30, 1959, leg. K. Glanc (KRAM-L 39396); Pszczeliny village, *Abies alba*, July 29, 1959, leg. K. Glanc (KRAM-L 39387). **FG-68** – Beskidy Lesiste Mountains, West Bieszczady Mountains: Puszcza Bukowa (Beech Forest), by Wielki Lutowy Stream, *Fagus sylvatica*, August 18, 1958, leg. K. Glanc (KRAM-L 39377); *Fagus sylvatica*, August 23, 1957, leg. Z. Tobolewski, (POZ); *Abies alba*, August 28, 1957, leg. K. Glanc (KRAM-L 39374). **GB-10** – Pojezierze Litewskie (Lithuanian Lake District), Równina Augustowska (Augustów Plain): Wigry National Park, ca. 2 km of Mikołajewo village, *Pinus* sp., September. 1984, leg.
